We introduce an iterative method for a pair of hemirelatively nonexpansive mappings. Strong convergence of the purposed iterative method is obtained in a Banach space.

## 1. Introduction and Preliminaries

Let $E$ be a Banach space with the dual $E^{*}$. We denote by $J$ the normalized duality mapping from $E$ to $2^{E^{*}}$ defined by

$$
\begin{equation*}
J x=\left\{f^{*} \in E^{*}:\left\langle x, f^{*}\right\rangle=\|x\|^{2}=\left\|f^{*}\right\|^{2}\right\}, \tag{1.1}
\end{equation*}
$$

where $\langle\cdot, \cdot\rangle$ denotes the generalized duality pairing. A Banach space $E$ is said to be strictly convex if $\|(x+y) / 2\|<1$ for all $x, y \in E$ with $\|x\|=\|y\|=1$ and $x \neq y$. It is said to be uniformly convex if $\lim _{n \rightarrow \infty}\left\|x_{n}-y_{n}\right\|=0$ for any two sequences $\left\{x_{n}\right\}$ and $\left\{y_{n}\right\}$ in $E$ such that $\left\|x_{n}\right\|=\left\|y_{n}\right\|=1$ and $\lim _{n \rightarrow \infty}\left\|\left(x_{n}+y_{n}\right) / 2\right\|=1$. Let $U_{E}=\{x \in E:\|x\|=1\}$ be the unit sphere of $E$. Then the Banach space $E$ is said to be smooth provided that

$$
\begin{equation*}
\lim _{t \rightarrow 0} \frac{\|x+t y\|-\|x\|}{t} \tag{1.2}
\end{equation*}
$$

exists for each $x, y \in U_{E}$. It is also said to be uniformly smooth if the limit (1.2) is attained uniformly for $x, y \in U_{E}$. It is well known that if $E$ is uniformly smooth, then $J$ is uniformly norm-to-norm continuous on each bounded subset of $E$. It is also well known that $E$ is uniformly smooth if and only if $E^{*}$ is uniformly convex.

Recall that a Banach space $E$ has the Kadec-Klee property if for any sequences $\left\{x_{n}\right\} \subset E$ and $x \in E$ with $x_{n} \rightharpoonup x$ and $\left\|x_{n}\right\| \rightarrow\|x\|$, then $\left\|x_{n}-x\right\| \rightarrow 0$ as $n \rightarrow \infty$; for more details on Kadec-Klee property, the readers is referred to [1,2] and the references therein. It is well known that if $E$ is a uniformly convex Banach space, then $E$ enjoys the Kadec-Klee property.

Let $C$ be a nonempty closed and convex subset of a Banach space $E$ and $T: C \rightarrow$ $C$ a mapping. The mapping $T$ is said to be closed if for any sequence $\left\{x_{n}\right\} \subset C$ such that $\lim _{n \rightarrow \infty} x_{n}=x_{0}$ and $\lim _{n \rightarrow \infty} T x_{n}=y_{0}$, then $T x_{0}=y_{0}$. A point $x \in C$ is a fixed point of $T$ provided $T x=x$. In this paper, we use $F(T)$ to denote the fixed point set of $T$ and use $\rightarrow$ and $\rightarrow$ to denote the strong convergence and weak convergence, respectively.

Recall that the mapping $T$ is said to be nonexpansive if

$$
\begin{equation*}
\|T x-T y\| \leq\|x-y\|, \quad \forall x, y \in C \tag{1.3}
\end{equation*}
$$

It is well known that if $C$ is a nonempty bounded closed and convex subset of a uniformly convex Banach space $E$, then every nonexpansive self-mapping $T$ on $C$ has a fixed point. Further, the fixed point set of $T$ is closed and convex.

As we all know that if $C$ is a nonempty closed convex subset of a Hilbert space $H$ and $P_{C}: H \rightarrow C$ is the metric projection of $H$ onto $C$, then $P_{C}$ is nonexpansive. This fact actually characterizes Hilbert spaces and consequently, it is not available in more general Banach spaces. In this connection, Alber [3] recently introduced a generalized projection operator $\Pi_{C}$ in a Banach space $E$ which is an analogue of the metric projection in Hilbert spaces.

Next, we assume that $E$ is a smooth Banach space. Consider the functional defined by

$$
\begin{equation*}
\phi(x, y)=\|x\|^{2}-2\langle x, J y\rangle+\|y\|^{2} \quad \text { for } x, y \in E \tag{1.4}
\end{equation*}
$$

Observe that, in a Hilbert space $H$, (1.4) is reduced to $\phi(x, y)=\|x-y\|^{2}, x, y \in H$. The generalized projection $\Pi_{C}: E \rightarrow C$ is a map that assigns to an arbitrary point $x \in E$, the minimum point of the functional $\phi(x, y)$, that is, $\Pi_{C} x=\bar{x}$, where $\bar{x}$ is the solution to the minimization problem

$$
\begin{equation*}
\phi(\bar{x}, x)=\min _{y \in C} \phi(y, x) \tag{1.5}
\end{equation*}
$$

Existence and uniqueness of the operator $\Pi_{C}$ follow from the properties of the functional $\phi(x, y)$ and strict monotonicity of the mapping $J$ (see, e.g., [1-4]). In Hilbert spaces, $\Pi_{C}=P_{C}$. It is obvious from the definition of function $\phi$ that

$$
\begin{equation*}
(\|y\|-\|x\|)^{2} \leq \phi(y, x) \leq(\|y\|+\|x\|)^{2}, \quad \forall x, y \in E \tag{1.6}
\end{equation*}
$$

Remark 1.1. If $E$ is a reflexive, strictly convex and smooth Banach space, then for $x, y \in E$, $\phi(x, y)=0$ if and only if $x=y$. It is sufficient to show that if $\phi(x, y)=0$ then $x=y$. From
(1.6), we have $\|x\|=\|y\|$. This implies that $\langle x, J y\rangle=\|x\|^{2}=\|J y\|^{2}$. From the definition of $J$, we have $J x=J y$. Therefore, we have $x=y$; see $[1,2]$ for more details.

Let $C$ be a nonempty closed convex subset of $E$ and $T$ a mapping from $C$ into itself. A point $p$ in $C$ is said to be an asymptotic fixed point of $T$ [5] if $C$ contains a sequence $\left\{x_{n}\right\}$ which converges weakly to $p$ such that $\lim _{n \rightarrow \infty}\left\|x_{n}-T x_{n}\right\|=0$. The set of asymptotic fixed points of $T$ will be denoted by $\widetilde{F}(T)$. A mapping $T$ from $C$ into itself is said to be relatively nonexpansive $[3,6,7]$ if $\tilde{F}(T)=F(T) \neq \emptyset$ and $\phi(p, T x) \leq \phi(p, x)$ for all $x \in C$ and $p \in F(T)$. The mapping $T$ is said to be hemirelatively nonexpansive [8-12] if $F(T) \neq \emptyset$ and $\phi(p, T x) \leq \phi(p, x)$ for all $x \in C$ and $p \in F(T)$. The asymptotic behavior of a relatively nonexpansive mappings was studied in $[3,6,7]$.

Remark 1.2. The class of hemirelatively nonexpansive mappings is more general than the class of relatively nonexpansive mappings which requires the restriction: $F(T)=\tilde{F}(T)$. From Su et al. [11], we see that every hemirelatively nonexpansive mapping is relatively nonexpansive, but the inverse is not true. Hemirelatively nonexpansive mapping is also said to be quasi- $\phi$-nonexpansive; see [13-17].

Recently, fixed point iterations of relatively nonexpansive mappings and hemirelatively nonexpansive mappings have been considered by many authors; see, for example [1425] and the references therein. In 2005, Matsushita and Takahashi [8] considered fixed point problems of a single relatively nonexpansive mapping in a Banach space. To be more precise, they proved the following theorem.

Theorem MT. Let E be a uniformly convex and uniformly smooth Banach space; let $C$ be a nonempty closed convex subset of $E$; let $T$ be a relatively nonexpansive mapping from $C$ into itself; let $\left\{\alpha_{n}\right\}$ be a sequence of real numbers such that $0 \leq \alpha_{n}<1$ and $\limsup _{n \rightarrow \infty} \alpha_{n}<1$. Suppose that $\left\{x_{n}\right\}$ is given by

$$
\begin{gather*}
x_{0}=x \in C, \\
y_{n}=J^{-1}\left(\alpha_{n} J x_{n}+\left(1-\alpha_{n}\right) J T x_{n}\right), \\
H_{n}=\left\{z \in C: \phi\left(z, y_{n}\right) \leq \phi\left(z, x_{n}\right)\right\},  \tag{1.7}\\
W_{n}=\left\{z \in C:\left\langle x_{n}-z, J x-J x_{n}\right\rangle \geq 0\right\}, \\
x_{n+1}=P_{H_{n} \cap W_{n}} x_{0}, \quad n=0,1,2, \ldots,
\end{gather*}
$$

where $J$ is the duality mapping on $E$. If $F(T)$ is nonempty, then $\left\{x_{n}\right\}$ converges strongly to $P_{F(T)} x$, where $P_{F(T)}$ is the generalized projection from C onto $F(T)$.

In 2007, Plubtieng and Ungchittrakool [9] further improved Theorem MT by considering a pair of relatively nonexpansive mappings. To be more precise, they proved the following theorem.

Theorem PU. Let E be a uniformly convex and uniformly smooth Banach space, and let $C$ be a nonempty closed convex subset of $E$. Let $S$ and $T$ be two relatively nonexpansive mappings from $C$ into itself with $F:=F(T) \cap F(S)$ being nonempty. Let a sequence $\left\{x_{n}\right\}$ be defined by

$$
\begin{gather*}
x_{0}=x \in C, \\
y_{n}=J^{-1}\left(\alpha_{n} J x_{n}+\left(1-\alpha_{n}\right) J z_{n}\right), \\
z_{n}=J^{-1}\left(\beta_{n}^{1} J x_{n}+\beta_{n}^{2} J T x_{n}+\beta_{n}^{3} J S x_{n}\right),  \tag{1.8}\\
H_{n}=\left\{z \in C: \phi\left(z, y_{n}\right) \leq \phi\left(z, x_{n}\right)\right\}, \\
W_{n}=\left\{z \in C:\left\langle x_{n}-z, J x-J x_{n}\right\rangle \geq 0\right\}, \\
x_{n+1}=\Pi_{H_{n} \cap W_{n}} x, \quad \forall n \geq 0,
\end{gather*}
$$

with the following restrictions:
(1) $0 \leq \alpha_{n}<1$ for each $n \geq 0$ and $\lim \sup _{n \rightarrow \infty} \alpha_{n}<1$;
(2) $0 \leq \beta_{n}^{1}, \beta_{n}^{2}, \beta_{n}^{3} \leq 1, \beta_{n}^{1}+\beta_{n}^{2}+\beta_{n}^{3}=1$ for each $n \geq 0, \lim _{n \rightarrow \infty} \beta_{n}^{1}=0$ and $\lim _{\inf }^{n \rightarrow \infty}, ~ \beta_{n}^{2} \beta_{n}^{3}>$ 0 .

Then the sequence $\left\{x_{n}\right\}$ converges strongly to $\Pi_{F} x$, where $\Pi_{F}$ is the generalized projection from $C$ onto $F$.

Very recently, Su et al. [11] improved Theorem PU partially by considering a pair of hemirelatively nonexpansive mappings. To be more precise, they obtained the following results.

Theorem SWX. Let E be a uniformly convex and uniformly smooth Banach space, and let C be a nonempty closed convex subset of $E$. Let $S$ and $T$ be two closed hemirelatively nonexpansive mappings from $C$ into itself with $F:=F(T) \cap F(S)$ being nonempty. Let a sequence $\left\{x_{n}\right\}$ be defined by

$$
\begin{gather*}
x_{0}=x \in C, \\
y_{n}=J^{-1}\left(\alpha_{n} J x_{n}+\left(1-\alpha_{n}\right) J z_{n}\right), \\
z_{n}=J^{-1}\left(\beta_{n}^{1} J x_{n}+\beta_{n}^{2} J T x_{n}+\beta_{n}^{3} J S x_{n}\right), \\
C_{n}=\left\{z \in C_{n-1} \cap Q_{n-1}: \phi\left(z, y_{n}\right) \leq \phi\left(z, x_{n}\right)\right\},  \tag{1.9}\\
C_{0}=\left\{z \in C \cap Q_{n-1}: \phi\left(z, y_{0}\right) \leq \phi\left(z, x_{0}\right)\right\}, \\
Q_{n}=\left\{z \in C_{n-1} \cap Q_{n-1}:\left\langle x_{n}-z, J x-J x_{n}\right\rangle \geq 0\right\}, \\
Q_{0}=C, \\
x_{n+1}=\Pi_{C_{n} \cap Q_{n}} x_{0}, \quad \forall n \geq 0,
\end{gather*}
$$

with the following restrictions:
(1) $\liminf _{n \rightarrow \infty} \beta_{n}^{1} \beta_{n}^{2}>0$;
(2) $\liminf \operatorname{in}_{n \rightarrow \infty} \beta_{n}^{1} \beta_{n}^{3}>0$;
(3) $0 \leq \alpha_{n} \leq \alpha<1$ for some $\alpha \in(0,1)$.

Then the sequence $\left\{x_{n}\right\}$ converges strongly to $\Pi_{F} x$, where $\Pi_{F}$ is the generalized projection from $C$ onto $F$.

In this paper, motivated by Theorems MT, PU, and SWX, we consider the problem of finding a common fixed point of a pair of hemirelatively nonexpansive mappings by shrinking projection methods which were introduced by Takahashi et al. [26] in Hilbert spaces. Strong convergence theorems of common fixed points are established in a Banach space. The results presented in this paper mainly improve the corresponding results announced in Matsushita and Takahashi [8], Nakajo and Takahahsi [27], and Su et al. [11].

In order to prove our main results, we need the following lemmas.
Lemma 1.3 (see [3]). Let C be a nonempty closed convex subset of a smooth Banach space E and $x \in E$. Then, $x_{0}=\Pi_{C} x$ if and only if

$$
\begin{equation*}
\left\langle x_{0}-y, J x-J x_{0}\right\rangle \geq 0 \quad \forall y \in C . \tag{1.10}
\end{equation*}
$$

Lemma 1.4 (see [3]). Let E be a reflexive, strictly convex and smooth Banach space, C a nonempty closed convex subset of $E$, and $x \in E$. Then

$$
\begin{equation*}
\phi\left(y, \Pi_{C} x\right)+\phi\left(\Pi_{C} x, x\right) \leq \phi(y, x) \quad \forall y \in C . \tag{1.11}
\end{equation*}
$$

The following lemma can be deduced from Matsushita and Takahashi [8].
Lemma 1.5. Let E be a strictly convex and smooth Banach space, $C$ a nonempty closed convex subset of $E$ and $T: C \rightarrow C$ a hemirelatively nonexpansive mapping. Then $F(T)$ is a closed convex subset of C.

Lemma 1.6 (see [28]). Let E be a uniformly convex Banach space and $B_{r}(0)$ a closed ball of $E$. Then there exists a continuous strictly increasing convex function $g:[0, \infty) \rightarrow[0, \infty)$ with $g(0)=0$ such that

$$
\begin{equation*}
\|\lambda x+\mu y+\gamma z\|^{2} \leq \lambda\|x\|^{2}+\mu\|y\|^{2}+\gamma\|z\|^{2}-\lambda \mu g(\|x-y\|) \tag{1.12}
\end{equation*}
$$

for all $x, y, z \in B_{r}(0)$ and $\lambda, \mu, \gamma \in[0,1]$ with $\lambda+\mu+\gamma=1$.

## 2. Main Results

Theorem 2.1. Let E be a uniformly smooth and strictly convex Banach space which enjoys the KadecKlee property and $C$ a nonempty closed and convex subset of $E$. Let $T: C \rightarrow C$ and $S: C \rightarrow C$ be
two closed and hemirelatively nonexpansive mappings such that $\mathcal{F}=F(T) \cap F(S)$ is nonempty. Let $\left\{x_{n}\right\}$ be a sequence generated in the following manner:

$$
\begin{gather*}
x_{0} \in E \text { chosen arbitrarily, } \\
C_{1}=C, \\
x_{1}=\Pi_{C_{1}} x_{0}, \\
z_{n}=J^{-1}\left(\beta_{n, 0} J x_{n}+\beta_{n, 1} J T x_{n}+\beta_{n, 2} J S x_{n}\right),  \tag{2.1}\\
y_{n}=J^{-1}\left(\alpha_{n} J x_{n}+\left(1-\alpha_{n}\right) J z_{n}\right), \\
C_{n+1}=\left\{z \in C_{n}: \phi\left(z, y_{n}\right) \leq \phi\left(z, x_{n}\right)\right\}, \\
x_{n+1}=\Pi_{C_{n+1}} x_{0}, \quad \forall n \geq 0,
\end{gather*}
$$

where $\left\{\alpha_{n}\right\},\left\{\beta_{n, 0}\right\},\left\{\beta_{n, 1}\right\}$, and $\left\{\beta_{n, 2}\right\}$ are real sequences in $[0,1]$ satisfying the following restrictions:
(a) $\limsup \operatorname{sum}_{n \rightarrow \infty} \alpha_{n}<1$;
(b) $\beta_{n, 0}+\beta_{n, 1}+\beta_{n, 2}=1$;
(c) $\liminf _{n \rightarrow \infty} \beta_{n, 0} \beta_{n, 1}>0$ and $\liminf _{n \rightarrow \infty} \beta_{n, 0} \beta_{n, 2}>0$.

Then $\left\{x_{n}\right\}$ converges strongly to $\Pi_{\mathscr{F}} x_{0}$, where $\Pi_{\mathscr{F}}$ is the generalized projection from $E$ onto $\mathcal{F}$.
Proof. First, we show that $C_{n}$ is closed and convex for each $n \geq 1$. It is obvious that $C_{1}=C$ is closed and convex. Suppose that $C_{h}$ is closed and convex for some $h$. For $z \in C_{h}$, we see that $\phi\left(z, y_{h}\right) \leq \phi\left(z, x_{h}\right)$ is equivalent to

$$
\begin{equation*}
2\left\langle z, J x_{h}-J y_{h}\right\rangle \leq\left\|x_{h}\right\|^{2}-\left\|y_{h}\right\|^{2} \tag{2.2}
\end{equation*}
$$

It is easy to see that $C_{h+1}$ is closed and convex. Then, for each $n \geq 1, C_{n}$ is closed and convex. Now, we are in a position to show that $\mathcal{F} \subset C_{n}$ for each $n \geq 1$. Indeed, $\mathcal{F} \subset C_{1}=C$ is obvious. Suppose that $\mathcal{F} \subset C_{h}$ for some $h$. Then, for all $w \in \mathscr{F} \subset C_{h}$, we have

$$
\begin{align*}
\phi\left(w, z_{h}\right)= & \phi\left(w, J^{-1}\left(\beta_{h, 0} J x_{h}+\beta_{h, 1} J T x_{h}+\beta_{h, 2} J S x_{h}\right)\right) \\
= & \|w\|^{2}-2\left\langle w, \beta_{h, 0} J x_{h}+\beta_{h, 1} J T x_{h}+\beta_{h, 2} J S x_{h}\right\rangle \\
& +\left\|\beta_{h, 0} J x_{h}+\beta_{h, 1} J T x_{h}+\beta_{h, 2} J S x_{h}\right\|^{2} \\
\leq & \|w\|^{2}-2 \beta_{h, 0}\left\langle w, J x_{h}\right\rangle-2 \beta_{h, 1}\left\langle w, J T x_{h}\right\rangle-2 \beta_{h, 2}\left\langle w, J S x_{h}\right\rangle  \tag{2.3}\\
& +\beta_{h, 0}\left\|x_{h}\right\|^{2}+\beta_{h, 1}\left\|T x_{h}\right\|^{2}+\beta_{h, 2}\left\|s x_{h}\right\|^{2} \\
= & \beta_{h, 0} \phi\left(w, x_{h}\right)+\beta_{h, 1} \phi\left(w, T x_{h}\right)+\beta_{h, 2} \phi\left(w, S x_{h}\right) \\
\leq & \beta_{h, 0} \phi\left(w, x_{h}\right)+\beta_{h, 1} \phi\left(w, x_{h}\right)+\beta_{h, 2} \phi\left(w, x_{h}\right) \\
= & \phi\left(w, x_{h}\right) .
\end{align*}
$$

It follows that

$$
\begin{align*}
\phi\left(w, y_{h}\right) & =\phi\left(w, J^{-1}\left(\alpha_{h} J x_{h}+\left(1-\alpha_{h}\right) J z_{h}\right)\right) \\
& =\|w\|^{2}-2\left\langle w, \alpha_{h} J x_{h}+\left(1-\alpha_{h}\right) J z_{h}\right\rangle+\left\|\alpha_{h} J x_{h}+\left(1-\alpha_{h}\right) J z_{h}\right\|^{2} \\
& \leq\|w\|^{2}-2 \alpha_{h}\left\langle w, J x_{h}\right\rangle-2\left(1-\alpha_{h}\right)\left\langle w, J z_{h}\right\rangle+\alpha_{h}\left\|x_{h}\right\|^{2}+\left(1-\alpha_{h}\right)\left\|z_{h}\right\|^{2}  \tag{2.4}\\
& =\alpha_{h} \phi\left(w, x_{h}\right)+\left(1-\alpha_{h}\right) \phi\left(w, z_{h}\right) \\
& \leq \alpha_{h} \phi\left(w, x_{h}\right)+\left(1-\alpha_{h}\right) \phi\left(w, x_{h}\right) \\
& =\phi\left(w, x_{h}\right)
\end{align*}
$$

which shows that $w \in C_{h+1}$. This implies that $\mathcal{F} \subset C_{n}$ for each $n \geq 1$. On the other hand, we obtain from Lemma 1.4 that

$$
\begin{equation*}
\phi\left(x_{n}, x_{0}\right)=\phi\left(\Pi_{C_{n}} x_{0}, x_{0}\right) \leq \phi\left(w, x_{0}\right)-\phi\left(w, x_{n}\right) \leq \phi\left(w, \mathrm{x}_{0}\right) \tag{2.5}
\end{equation*}
$$

for each $w \in \mathscr{F} \subset C_{n}$ and for each $n \geq 1$. This shows that the sequence $\phi\left(x_{n}, x_{0}\right)$ is bounded. From (1.6), we see that the sequence $\left\{x_{n}\right\}$ is also bounded. Since the space is reflexive, we may, without loss of generality, assume that $x_{n} \rightharpoonup \bar{x}$. Note that $C_{n}$ is closed and convex for each $n \geq 1$. It is easy to see that $\bar{x} \in C_{n}$ for each $n \geq 1$. Note that

$$
\begin{equation*}
\phi\left(x_{n}, x_{0}\right) \leq \phi\left(\bar{x}, x_{0}\right) \tag{2.6}
\end{equation*}
$$

It follows that

$$
\begin{equation*}
\phi\left(\bar{x}, x_{0}\right) \leq \liminf _{n \rightarrow \infty} \phi\left(x_{n}, x_{0}\right) \leq \limsup _{n \rightarrow \infty} \phi\left(x_{n}, x_{0}\right) \leq \phi\left(\bar{x}, x_{0}\right) \tag{2.7}
\end{equation*}
$$

This implies that

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \phi\left(x_{n}, x_{0}\right)=\phi\left(\bar{x}, x_{0}\right) \tag{2.8}
\end{equation*}
$$

Hence, we have $\left\|x_{n}\right\| \rightarrow\|\bar{x}\|$ as $n \rightarrow \infty$. In view of the Kadec-Klee property of $E$, we obtain that $x_{n} \rightarrow \bar{x}$ as $n \rightarrow \infty$.

Next, we show that $\bar{x} \in F(T)$. By the construction of $C_{n}$, we have that $C_{n+1} \subset C_{n}$ and $x_{n+1}=\Pi_{C_{n+1}} x_{0} \in C_{n}$. It follows that

$$
\begin{align*}
\phi\left(x_{n+1}, x_{n}\right) & =\phi\left(x_{n+1}, \Pi_{C_{n}} x_{0}\right) \\
& \leq \phi\left(x_{n+1}, x_{0}\right)-\phi\left(\Pi_{C_{n}} x_{0}, x_{0}\right)  \tag{2.9}\\
& =\phi\left(x_{n+1}, x_{0}\right)-\phi\left(x_{n}, x_{0}\right)
\end{align*}
$$

Letting $n \rightarrow \infty$ in (2.9), we obtain that $\phi\left(x_{n+1}, x_{n}\right) \rightarrow 0$. In view of $x_{n+1} \in C_{n+1}$, we arrive at $\phi\left(x_{n+1}, y_{n}\right) \leq \phi\left(x_{n+1}, x_{n}\right)$. It follows that

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \phi\left(x_{n+1}, y_{n}\right)=0 \tag{2.10}
\end{equation*}
$$

From (1.6), we can obtain that

$$
\begin{equation*}
\left\|y_{n}\right\| \longrightarrow\|\bar{x}\| \quad \text { as } n \longrightarrow \infty . \tag{2.11}
\end{equation*}
$$

It follows that

$$
\begin{equation*}
\left\|J y_{n}\right\| \longrightarrow\|J \bar{x}\| \quad \text { as } n \longrightarrow \infty \tag{2.12}
\end{equation*}
$$

This implies that $\left\{J y_{n}\right\}$ is bounded. Note that $E$ is reflexive and $E^{*}$ is also reflexive. We may assume that $J y_{n} \rightharpoonup x^{*} \in E^{*}$. In view of the reflexivity of $E$, we see that $J(E)=E^{*}$. This shows that there exists an $x \in E$ such that $J x=x^{*}$. It follows that

$$
\begin{align*}
\phi\left(x_{n+1}, y_{n}\right) & =\left\|x_{n+1}\right\|^{2}-2\left\langle x_{n+1}, J y_{n}\right\rangle+\left\|y_{n}\right\|^{2}  \tag{2.13}\\
& =\left\|x_{n+1}\right\|^{2}-2\left\langle x_{n+1}, J y_{n}\right\rangle+\left\|J y_{n}\right\|^{2}
\end{align*}
$$

Taking $\lim \inf _{n \rightarrow \infty}$, the both sides of equality above yield that

$$
\begin{align*}
0 & \geq\|\bar{x}\|^{2}-2\left\langle\bar{x}, x^{*}\right\rangle+\left\|x^{*}\right\|^{2} \\
& =\|\bar{x}\|^{2}-2\langle\bar{x}, J x\rangle+\|J x\|^{2} \\
& =\|\bar{x}\|^{2}-2\langle\bar{x}, J x\rangle+\|x\|^{2}  \tag{2.14}\\
& =\phi(\bar{x}, x) .
\end{align*}
$$

That is, $\bar{x}=x$, which in turn implies that $x^{*}=J \bar{x}$. It follows that $J y_{n} \rightharpoonup J \bar{x} \in E^{*}$.From (2.12) and since $E^{*}$ enjoys the Kadec-Klee property, we obtain that

$$
\begin{equation*}
J y_{n}-J \bar{x} \longrightarrow 0 \quad \text { as } n \longrightarrow \infty \tag{2.15}
\end{equation*}
$$

Note that $J^{-1}: E^{*} \rightarrow E$ is demicontinuous. It follows that $y_{n} \rightharpoonup \bar{x}$. From (2.11) and since $E$ enjoys the Kadec-Klee property, we obtain that

$$
\begin{equation*}
y_{n} \longrightarrow \bar{x} \quad \text { as } n \longrightarrow \infty \tag{2.16}
\end{equation*}
$$

Note that

$$
\begin{equation*}
\left\|x_{n}-y_{n}\right\| \leq\left\|x_{n}-\bar{x}\right\|+\left\|\bar{x}-y_{n}\right\| . \tag{2.17}
\end{equation*}
$$

It follows that

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|x_{n}-y_{n}\right\|=0 \tag{2.18}
\end{equation*}
$$

Since $J$ is uniformly norm-to-norm continuous on any bounded sets, we have

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|J x_{n}-J y_{n}\right\|=0 \tag{2.19}
\end{equation*}
$$

On the other hand, we see from the definition of $y_{n}$ that

$$
\begin{equation*}
\left\|J y_{n}-J x_{n}\right\|=\left(1-\alpha_{n}\right)\left\|J z_{n}-J x_{n}\right\| . \tag{2.20}
\end{equation*}
$$

In view of the assumption on $\left\{\alpha_{n}\right\}$ and (2.19), we see that

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|J x_{n}-J z_{n}\right\|=0 \tag{2.21}
\end{equation*}
$$

On the other hand, since $J: E \rightarrow E^{*}$ is demicontinuous, we have $J x_{n} \rightharpoonup J \bar{x} \in E^{*}$. In view of

$$
\begin{equation*}
\left|\left\|J x_{n}\right\|-\|J \bar{x}\|\right|=\left|\left\|x_{n}\right\|-\|\bar{x}\|\right| \leq\left\|x_{n}-\bar{x}\right\|, \tag{2.22}
\end{equation*}
$$

we arrive at $\left\|J x_{n}\right\| \rightarrow\|J \bar{x}\|$ as $n \rightarrow \infty$. By virtue of the Kadec-Klee property of $E^{*}$, we obtain that $\left\|J x_{n}-J \bar{x}\right\| \rightarrow 0$ as $n \rightarrow \infty$. Note that

$$
\begin{equation*}
\left\|J z_{n}-J \bar{x}\right\| \leq\left\|J z_{n}-J x_{n}\right\|+\left\|J x_{n}-J \bar{x}\right\| . \tag{2.23}
\end{equation*}
$$

In view of (2.21), we arrive at $\lim _{n \rightarrow \infty}\left\|J z_{n}-J \bar{x}\right\|=0$. Since $J^{-1}: E^{*} \rightarrow E$ is demicontinuous, we have $z_{n}-\bar{x}$. Note that

$$
\begin{equation*}
\left|\left\|z_{n}\right\|-\left\|x_{n}\right\|\right|=\left|\left\|J z_{n}\right\|-\|J \bar{x}\|\right| \leq\left\|J z_{n}-J \bar{x}\right\| . \tag{2.24}
\end{equation*}
$$

It follows that $\left\|z_{n}\right\| \rightarrow\|\bar{x}\|$ as $n \rightarrow \infty$. Since $E$ enjoys the Kadec-Klee property, we obtain that $\lim _{n \rightarrow \infty}\left\|z_{n}-\bar{x}\right\|=0$. Note that

$$
\begin{equation*}
\left\|z_{n}-x_{n}\right\| \leq\left\|z_{n}-\bar{x}\right\|+\left\|\bar{x}-x_{n}\right\| . \tag{2.25}
\end{equation*}
$$

It follows that

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|z_{n}-x_{n}\right\|=0 . \tag{2.26}
\end{equation*}
$$

Let $r=\max \left\{\sup _{n \geq 1}\left\{\left\|x_{n}\right\|\right\}, \sup _{n \geq 1}\left\{\left\|T x_{n}\right\|\right\}, \sup _{n \geq 1}\left\{\left\|S x_{n}\right\|\right\}\right\}$. Fixing $q \in \mathcal{F}$, we have from Lemma 1.6 that

$$
\begin{align*}
\phi\left(q, z_{n}\right)= & \phi\left(q, J^{-1}\left(\beta_{n, 0} J x_{n}+\beta_{n, 1} J T x_{n}+\beta_{n, 2} J S x_{n}\right)\right) \\
= & \left.\|q\|^{2}-2\left\langle q, \beta_{n, 0} J x_{n}+\beta_{n, 1} J T x_{n}+\beta_{n, 2} J S x_{n}\right)\right\rangle \\
& +\left\|\beta_{n, 0} J x_{n}+\beta_{n, 1} J T x_{n}+\beta_{n, 2} J S x_{n}\right\|^{2} \\
\leq & \|q\|^{2}-2 \beta_{n, 0}\left\langle q, J x_{n}\right\rangle-2 \beta_{n, 1}\left\langle q, J T x_{n}\right\rangle-2 \beta_{n, 2}\left\langle q, J S x_{n}\right\rangle  \tag{2.27}\\
& +\beta_{n, 0}\left\|J x_{n}\right\|^{2}+\beta_{n, 1}\left\|J T x_{n}\right\|^{2}+\beta_{n, 2}\left\|J S x_{n}\right\|^{2}-\beta_{n, 0} \beta_{n, 1} g\left(\left\|J x_{n}-J T x_{n}\right\|\right) \\
= & \beta_{n, 0} \phi\left(q, x_{n}\right)+\beta_{n, 1} \phi\left(q, T x_{n}\right)+\beta_{n, 2} \phi\left(q, S x_{n}\right)-\beta_{n, 0} \beta_{n, 1} g\left(\left\|J x_{n}-J T x_{n}\right\|\right) \\
\leq & \beta_{n, 0} \phi\left(q, x_{n}\right)+\beta_{n, 1} \phi\left(q, x_{n}\right)+\beta_{n, 2} \phi\left(q, x_{n}\right)-\beta_{n, 0} \beta_{n, 1} g\left(\left\|J x_{n}-J T x_{n}\right\|\right) \\
= & \phi\left(q, x_{n}\right)-\beta_{n, 0} \beta_{n, 1} g\left(\left\|J x_{n}-J T x_{n}\right\|\right) .
\end{align*}
$$

It follows that

$$
\begin{equation*}
\beta_{n, 0} \beta_{n, 1} g\left(\left\|J x_{n}-J T x_{n}\right\|\right) \leq \phi\left(q, x_{n}\right)-\phi\left(q, z_{n}\right) . \tag{2.28}
\end{equation*}
$$

On the other hand, we have

$$
\begin{align*}
\phi\left(q, x_{n}\right)-\phi\left(q, z_{n}\right) & =\left\|x_{n}\right\|^{2}-\left\|z_{n}\right\|^{2}-2\left\langle q, J x_{n}-J z_{n}\right\rangle  \tag{2.29}\\
& \leq\left\|x_{n}-z_{n}\right\|\left(\left\|x_{n}\right\|+\left\|z_{n}\right\|\right)+2\|q\|\left\|J x_{n}-J z_{n}\right\| .
\end{align*}
$$

It follows from (2.21) and (2.26) that

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left(\phi\left(q, x_{n}\right)-\phi\left(q, z_{n}\right)\right)=0 . \tag{2.30}
\end{equation*}
$$

In view of (2.28) and the assumption $\lim \inf _{n \rightarrow \infty} \beta_{n, 0} \beta_{n, 1}>0$, we see that

$$
\begin{equation*}
\lim _{n \rightarrow \infty} g\left(\left\|J x_{n}-J T x_{n}\right\|\right)=0 . \tag{2.31}
\end{equation*}
$$

It follows from the property of $g$ that

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|J x_{n}-J T x_{n}\right\|=0 \tag{2.32}
\end{equation*}
$$

Note that

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|J x_{n}-J \bar{x}\right\|=0 . \tag{2.33}
\end{equation*}
$$

On the other hand, we have

$$
\begin{equation*}
\left\|J T x_{n}-J \bar{x}\right\| \leq\left\|J T x_{n}-J x_{n}\right\|+\left\|J x_{n}-J \bar{x}\right\| \tag{2.34}
\end{equation*}
$$

From (2.32) and (2.33), we arrive at

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|J T x_{n}-J \bar{x}\right\|=0 \tag{2.35}
\end{equation*}
$$

Note that $J^{-1}: E^{*} \rightarrow E$ is demicontinuous. It follows that $T x_{n}-\bar{x}$. On the other hand, we have

$$
\begin{equation*}
\left|\left\|T x_{n}\right\|-\|\bar{x}\|\|=\mid\| J T x_{n}\|-\| J \bar{x}\| \| \leq\left\|J T x_{n}-J \bar{x}\right\| .\right. \tag{2.36}
\end{equation*}
$$

In view of (2.35), we obtain that $\left\|T x_{n}\right\| \rightarrow\|\bar{x}\|$ as $n \rightarrow \infty$. Since $E$ enjoys the Kadec-Klee property, we obtain that

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|T x_{n}-\bar{x}\right\|=0 \tag{2.37}
\end{equation*}
$$

It follows from the closedness of $T_{1}$ that $T \bar{x}=\bar{x}$. By repeating (2.27)-(2.37), we can obtain that $\bar{x} \in F(S)$. This shows that $\bar{x} \in \mathcal{F}$.

Finally, we show that $\bar{x}=\Pi_{\mathscr{q}} x_{0}$. From $x_{n}=\Pi_{C_{n}} x_{0}$, we have

$$
\begin{equation*}
\left\langle x_{n}-w, J x_{0}-J x_{n}\right\rangle \geq 0, \quad \forall w \in \mathcal{F} \subset C_{n} \tag{2.38}
\end{equation*}
$$

Taking the limit as $n \rightarrow \infty$ in (2.38), we obtain that

$$
\begin{equation*}
\left\langle\bar{x}-w, J x_{0}-J \bar{x}\right\rangle \geq 0, \quad \forall w \in \mathscr{F} \tag{2.39}
\end{equation*}
$$

and hence $\bar{x}=\Pi_{F(T)} x_{0}$ by Lemma 1.3. This completes the proof.
Remark 2.2. Theorem 2.1 improves Theorem SWX in the following aspects:
(a) from the point of view on computation, we remove the set " $Q_{n}$ " in Theorem SWX;
(b) from the point of view on the framework of spaces, we extend Theorem SWX from a uniformly smooth and uniformly convex Banach space to a uniformly smooth and strictly convex Banach space which enjoys the Kadec-Klee property. Note that every uniformly convex Banach space enjoys the Kadec-Klee property.

If $\alpha_{n}=0$ for each $n \geq 0$, then Theorem 2.1 is reduced to the following.
Corollary 2.3. Let $E$ be a uniformly smooth and strictly convex Banach space which enjoys the KadecKlee property and $C$ a nonempty closed and convex subset of $E$. Let $T: C \rightarrow C$ and $S: C \rightarrow C$ be two closed and hemirelatively nonexpansive mappings such that $\mathcal{F}=F(T) \cap F(S)$ is nonempty. Let $\left\{x_{n}\right\}$ be a sequence generated in the following manner:

$$
\begin{gather*}
x_{0} \in E \text { chosen arbitrarily, } \\
C_{1}=C, \\
x_{1}=\Pi_{C_{1}} x_{0}, \\
y_{n}=J^{-1}\left(\beta_{n, 0} J x_{n}+\beta_{n, 1} J T x_{n}+\beta_{n, 2} J S x_{n}\right),  \tag{2.40}\\
C_{n+1}=\left\{z \in C_{n}: \phi\left(z, y_{n}\right) \leq \phi\left(z, x_{n}\right)\right\}, \\
x_{n+1}=\Pi_{C_{n+1}} x_{0}, \quad \forall n \geq 0,
\end{gather*}
$$

where $\left\{\beta_{n, 0}\right\},\left\{\beta_{n, 1}\right\}$, and $\left\{\beta_{n, 2}\right\}$ are real sequences in $[0,1]$ satisfying the following restrictions:
(a) $\beta_{n, 0}+\beta_{n, 1}+\beta_{n, 2}=1$;
(b) $\liminf _{n \rightarrow \infty} \beta_{n, 0} \beta_{n, 1}>0$ and $\liminf _{n \rightarrow \infty} \beta_{n, 0} \beta_{n, 2}>0$.

Then $\left\{x_{n}\right\}$ converges strongly to $\Pi_{\mathscr{F}} x_{0}$, where $\Pi_{\mathcal{F}}$ is the generalized projection from E onto $\mathcal{F}$.
If $T=S$, then Corollary 2.3 is reduced to the following.
Corollary 2.4. Let E be a uniformly smooth and strictly convex Banach space which enjoys the Kadec-Klee property and $C$ a nonempty closed and convex subset of $E$. Let $T: C \rightarrow C$ be a closed and hemirelatively nonexpansive mapping with a nonempty fixed point set. Let $\left\{x_{n}\right\}$ be a sequence generated in the following manner:

$$
\begin{gather*}
x_{0} \in E \text { chosen arbitrarily, } \\
C_{1}=C, \\
x_{1}=\Pi_{C_{1}} x_{0}, \\
y_{n}=J^{-1}\left(\beta_{n} J x_{n}+\left(1-\beta_{n}\right) J T x_{n}\right),  \tag{2.41}\\
C_{n+1}=\left\{z \in C_{n}: \phi\left(z, y_{n}\right) \leq \phi\left(z, x_{n}\right)\right\}, \\
x_{n+1}=\Pi_{C_{n+1}} x_{0}, \quad \forall n \geq 0,
\end{gather*}
$$

where $\left\{\beta_{n}\right\}$ is a real sequence in $[0,1]$ satisfying $\liminf _{n \rightarrow \infty} \beta_{n}\left(1-\beta_{n}\right)>0$. Then $\left\{x_{n}\right\}$ converges strongly to $\Pi_{\mathscr{F}} x_{0}$, where $\Pi_{\mp}$ is the generalized projection from $E$ onto $\mathcal{F}$.
