# A NOTE ON THE FEKETE-SZEGÖ PROBLEM FOR CLOSE-TO-CONVEX FUNCTIONS WITH RESPECT TO CONVEX FUNCTIONS 

Bogumiła Kowalczyk, Adam Lecko, and H. M. Srivastava

#### Abstract

We discuss the sharpness of the bound of the Fekete-Szegö functional for close-to-convex functions with respect to convex functions. We also briefly consider other related developments involving the Fekete-Szegö functional $\left|a_{3}-\lambda a_{2}^{2}\right|(0 \leqslant \lambda \leqslant 1)$ as well as the corresponding Hankel determinant for the Taylor-Maclaurin coefficients $\left\{a_{n}\right\}_{n \in \mathbb{N} \backslash\{1\}}$ of normalized univalent functions in the open unit disk $\mathbb{D}, \mathbb{N}$ being the set of positive integers.

## 1. Introduction

A classical problem in geometric function theory of complex analysis, which was settled by Fekete and Szegö [4], is to find for each $\lambda \in[0,1]$ the maximum value of the coefficient functional $\Phi_{\lambda}(f)$ given by

$$
\begin{equation*}
\Phi_{\lambda}(f):=\left|a_{3}-\lambda a_{2}^{2}\right| \tag{1.1}
\end{equation*}
$$

over the class $\mathcal{S}$ of univalent functions $f$ in the open unit disk

$$
\mathbb{D}:=\{z: z \in \mathbb{C} \text { and }|z|<1\}
$$

of the following normalized form (see, for details, $\mathbf{5}, \mathbf{2 2}, \mathbf{2 4}$ ):

$$
\begin{equation*}
f(z)=z+\sum_{n=2}^{\infty} a_{n} z^{n} \quad(z \in \mathbb{D}) \tag{1.2}
\end{equation*}
$$

By applying the Loewner method, Fekete and Szegö 4 proved that

$$
\max _{f \in \mathcal{S}} \Phi_{\lambda}(f)= \begin{cases}1+2 \exp \left(-\frac{2 \lambda}{1-\lambda}\right) & (0 \leqslant \lambda<1) \\ 1 & (\lambda=1)\end{cases}
$$

[^0]For various compact subclasses $\mathcal{F}$ of the class $\mathcal{A}$ of all analytic functions $f$ in $\mathbb{D}$ of the form (1.2), as well as with $\lambda$ being an arbitrary real or complex number, many authors computed

$$
\begin{equation*}
\max _{f \in \mathcal{F}} \Phi_{\lambda}(f) \tag{1.3}
\end{equation*}
$$

or calculated the upper bound of (1.3) (see, e.g., [2, 8, 11, 21 ).
Let $\mathcal{S}^{*}$ denote the class of starlike functions, that is, $f \in \mathcal{S}^{*}$ if

$$
f \in \mathcal{A} \quad \text { and } \quad \operatorname{Re}\left(\frac{z f^{\prime}(z)}{f(z)}\right)>0 \quad(z \in \mathbb{D}) .
$$

Given $\delta \in\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ and $g \in \mathcal{S}^{*}$, let $\mathcal{C}_{\delta}(g)$ denote the class of functions called close-to-convex with argument $\delta$ with respect to $g$, that is, the class of all functions $f \in \mathcal{A}$ such that

$$
\begin{equation*}
\operatorname{Re}\left(e^{i \delta} \frac{z f^{\prime}(z)}{g(z)}\right)>0 \quad(z \in \mathbb{D}) \tag{1.4}
\end{equation*}
$$

We also suppose that, given $g \in \mathcal{S}^{*}, \mathcal{C}(g):=\bigcup_{g \in \mathcal{S}^{*}} \mathcal{C}_{\delta}(g)$ and that, given $\delta \in$ $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right), \mathcal{C}_{\delta}:=\bigcup_{g \in \mathcal{S}^{*}} \mathcal{C}_{\delta}(g)$. Let

$$
\mathcal{C}:=\bigcup_{\delta \in\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)} \bigcup_{g \in \mathcal{S}^{*}} \mathcal{C}_{\delta}(g)
$$

denote the class of close-to-convex functions (see, for details, [20, pp. 184-185], (6 10).

For the whole class $\mathcal{C}$, the sharp bound of the Fekete-Szegö coefficient functional $\Phi_{\lambda}$ for $\lambda \in[0,1]$, given by (1.1), was calculated by Koepf 13 who extended the earlier result for the class $\mathcal{C}_{0}$ and for $\lambda \in \mathbb{R}$ due to Keogh and Merkes [11, namely, it holds

$$
\max _{f \in \mathcal{C}} \Phi_{\lambda}(f)=\max _{f \in \mathcal{C}_{0}} \Phi_{\lambda}(f)= \begin{cases}|3-4 \lambda| & \left(\lambda \in\left(-\infty, \frac{1}{3}\right] \cup[1, \infty)\right) \\ \frac{1}{3}+\frac{4}{9 \lambda} & \left(\lambda \in\left[\frac{1}{3}, \frac{2}{3}\right]\right) \\ 1 & \left(\lambda \in\left[\frac{2}{3}, 1\right]\right)\end{cases}
$$

For various subclasses of the class of close-to-convex functions, the problem to estimate the coefficient functional $\Phi_{\lambda}$ is continued in several subsequent works (see, for details, $\mathbf{9}, \mathbf{1 2}, \mathbf{1 4}-16]$ ). Some interesting and important subclasses of the class $\mathcal{C}$ are the classes $\mathcal{C}_{\delta}^{c}$ and $\mathcal{C}^{c}$, which are defined below.

Let $\mathcal{S}^{c}$ denote the class of convex functions, that is, $f \in \mathcal{S}^{c}$ if

$$
f \in \mathcal{A} \quad \text { and } \quad \operatorname{Re}\left(1+\frac{z f^{\prime \prime}(z)}{f^{\prime}(z)}\right)>0 \quad(z \in \mathbb{D})
$$

Since $\mathcal{S}^{c} \subsetneq \mathcal{S}^{*}$, the class $\mathcal{C}_{\delta}^{c}:=\bigcup_{g \in \mathcal{S}^{c}} \mathcal{C}_{\delta}(g)$ is a proper subclass of the class $\mathcal{C}_{\delta}$ and the class

$$
\mathcal{C}^{c}:=\bigcup_{\delta \in\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)} \bigcup_{g \in \mathcal{S}^{c}} \mathcal{C}_{\delta}(g)
$$

is a proper subclass of the class $\mathcal{C}$.

The class $\mathcal{C}_{0}^{c}$ was defined by Abdel-Gawad and Thomas [1. The class $\mathcal{C}^{c}$ of close-to-convex functions with respect to convex functions was introduced by Srivastava, Mishra and Das [23. In both of these cited papers, the authors (Abdel-Gawad and Thomas [1] and Srivastava, Mishra and Das [23]) considered the coefficient functional $\Phi_{\lambda}$ with $\lambda \in[0,1]$ also. In fact, in Srivastava, Mishra and Das 23 extended, for the class $\mathcal{C}^{c}$, the earlier result of Abdel-Gawad and Thomas [1] for the class $\mathcal{C}_{0}^{c}$. However, in each of the above-cited papers, the proof for the sharpness of the bound in (1.3) for $\lambda \in\left(\frac{2}{3}, 1\right]$ was proposed incorrectly as $5 / 6$.

This note is motivated essentially by the earlier papers 1 and [23. The main purpose of our investigation here is to discuss such sharpness results for the bound in (1.3). We also provide a rather brief consideration of other related developments involving the Fekete-Szegö functional $\left|a_{3}-\lambda a_{2}^{2}\right|(0 \leqslant \lambda \leqslant 1)$ in (1.1) as well as the corresponding Hankel determinant for the Taylor-Maclaurin coefficients $\left\{a_{n}\right\}_{n \in \mathbb{N} \backslash\{1\}}$ of normalized univalent functions of the form (1.2).

## 2. Main Observation

As we remarked in Section 1, in both of the afore cited papers 1, 23, the upper bounds of the Fekete-Szegö coefficient functional $\Phi_{\lambda}(0 \leqslant \lambda \leqslant 1)$ for the classes $\mathcal{C}_{0}^{c}$ and $\mathcal{C}^{c}$, were computed. In fact, Theorems 5 and 6 of Srivastava, Mishra and Das [23] state that the following sharp inequality

$$
\begin{equation*}
\max _{f \in \mathcal{C}^{c}} \Phi_{\lambda}(f) \leqslant \frac{5}{6} \quad\left(\lambda \in\left[\frac{2}{3}, 1\right]\right) \tag{2.1}
\end{equation*}
$$

holds true and that this result is the same as in 1 for the class $\mathcal{C}_{0}^{c}$ (a part of Theorem 3). However, the assertion that the extremal function, for which the equality in (2.1) is satisfied when $\lambda \in\left(\frac{2}{3}, 1\right]$, belongs to $\mathcal{C}^{c}$ is incorrect. Indeed, here in this section, we note that the above-cited papers [1,23 contain a statement to the effect that the equality in (2.1) is attained by a function $f \in \mathcal{A}$ given by

$$
\begin{equation*}
\frac{z f^{\prime}(z)}{h(z)}=\frac{1+\omega(z)}{1-\omega(z)} \quad(z \in \mathbb{D}) \tag{2.2}
\end{equation*}
$$

where $h \in \mathcal{S}^{c}$ is of the form

$$
\begin{equation*}
h(z)=z+\sum_{n=2}^{\infty} b_{n} z^{n} \quad\left(z \in \mathbb{D} ; b_{2}=b_{3}:=1\right) \tag{2.3}
\end{equation*}
$$

and $\omega$ is a function of the form

$$
\begin{equation*}
\omega(z)=\sum_{n=1}^{\infty} \beta_{n} z^{n} \quad(z \in \mathbb{D}) \tag{2.4}
\end{equation*}
$$

with

$$
\begin{equation*}
\beta_{1}:=\frac{2-3 \lambda}{6 \lambda} \pm i \frac{\sqrt{6 \lambda-4}}{6 \lambda} \quad \text { and } \quad \beta_{2}:=1-\beta_{1}^{2} \tag{2.5}
\end{equation*}
$$

Unfortunately, however, $\omega$ is not a Schwarz function for $\lambda \in\left(\frac{2}{3}, 1\right]$. We recall here that a Schwarz function means an analytic self-mapping of $\mathbb{D}$ with $\omega(0):=0$. Let us
denote the class of Schwarz functions by $\mathcal{B}_{0}$. In order to see that $\omega \notin \mathcal{B}_{0}$, we verify (by straightforward computation) that, for $\lambda \in\left(\frac{2}{3}, 1\right]$, the following inequality:

$$
\begin{equation*}
\left|\beta_{2}\right| \leqslant 1-\left|\beta_{1}\right|^{2} \tag{2.6}
\end{equation*}
$$

is false, so a necessary condition for $\omega$ to be in $\mathcal{B}_{0}$ (see, for example, [5 Vol. II, p. 78]) does not hold true. Alternatively, in order to get a contradiction, we suppose that $\omega$ with its coefficients in (2.5) is a Schwarz function. Thus, clearly, (2.6) holds true. Hence we find from (2.5) that $1-\left|\beta_{1}\right|^{2} \geqslant\left|\beta_{2}\right|=\left|1-\beta_{1}^{2}\right| \geqslant 1-\left|\beta_{1}\right|^{2}$. Thus we have $\left|1-\beta_{1}^{2}\right|=1-\left|\beta_{1}\right|^{2}$ and, therefore, $\beta_{1}=\left|\beta_{1}\right|$ or $\beta_{1}=-\left|\beta_{1}\right|$. This means that $\beta_{1}$ is a real number, which by (2.5) is possible only for $\lambda=\frac{2}{3}$. Consequently, for $\lambda \in\left(\frac{2}{3}, 1\right]$, the function $\omega$ with its coefficients in (2.5) does not belong to $\mathcal{B}_{0}$. So, in light of (2.2), it does not follow that $f$ is in $\mathcal{C}^{c}$ or in $\mathcal{C}_{0}^{c}$.

Equivalently, let

$$
\begin{equation*}
p(z):=\frac{1+\omega(z)}{1-\omega(z)} \quad(z \in \mathbb{D}) \tag{2.7}
\end{equation*}
$$

where $\omega$ is as given above. Then

$$
\begin{equation*}
p(z)=1+\sum_{n=1}^{\infty} c_{n} z^{n} \quad(z \in \mathbb{D}) \tag{2.8}
\end{equation*}
$$

where, in view of (2.7), (2.4) and (2.5), we have $c_{1}=2 \beta_{1}$ and $c_{2}=2\left(\beta_{2}+\beta_{1}^{2}\right)=2$. We observe further that, for $\lambda \in\left(\frac{2}{3}, 1\right]$, the function $p$ does not belong to the Carathéodory class. We recall here that the Carathéodory class, denoted as $\mathcal{P}$, contains analytic functions $p$ of the form (2.8) with a positive real part. In order to see that $p \notin \mathbb{P}$, we verify for $\lambda \in\left(\frac{2}{3}, 1\right]$ that the inequality $\left|c_{2}-c_{1}^{2} / 2\right| \leqslant 2-\left|c_{1}\right|^{2} / 2$, is false, which happens to be a necessary condition for $p$ to be in the class $\mathbb{P}$ (see, for example, [22, p. 166]).

## 3. Concluding remarks and further developments

By means of Theorem 3 of Abdel-Gawad and Thomas [1] Theorems 1 to 4 of Srivastava, Mishra and Das [23, and in light of our observation in Section 2, we arrive at the following result.

## ThEOREM 1. Each of the following assertions holds true:

$$
\begin{align*}
& \max _{f \in \mathcal{C}^{c}} \Phi_{\lambda}(f)=\max _{f \in \mathcal{C}_{0}^{c}} \Phi_{\lambda}(f)= \begin{cases}\frac{5}{3}-\frac{9 \lambda}{4} & \left(\lambda \in\left[0, \frac{2}{9}\right]\right) \\
\frac{2}{3}+\frac{1}{9 \lambda} & \left(\lambda \in\left[\frac{2}{9}, \frac{2}{3}\right]\right)\end{cases}  \tag{3.1}\\
& \max _{f \in \mathcal{C}^{c}} \Phi_{\lambda}(f) \leqslant \frac{5}{6} \quad\left(\lambda \in\left(\frac{2}{3}, 1\right]\right) . \tag{3.2}
\end{align*}
$$

Remark 1. The sharpness of the inequality in (3.2) for the classes $\mathcal{C}^{c}$ and $\mathcal{C}_{0}^{c}$ is an open problem.

We now note that, by Loewner Theorem (see, for example, [5, Vol. I, p. 1127]), the function $h \in \mathcal{S}^{c}$ of the form (2.3) (with $b_{2}=b_{3}:=1$ ) is uniquely determined, that is, $h(z)=\frac{z}{1-z}=\sum_{n=1}^{\infty} z^{n}(z \in \mathbb{D})$. Then (1.4) with $g:=h$ is of the form

$$
\begin{equation*}
\operatorname{Re}\left(e^{i \delta}(1-z) f^{\prime}(z)\right)>0 \quad(z \in \mathbb{D}) \tag{3.3}
\end{equation*}
$$

and defines the class $\mathcal{C}_{\delta}(h)$, and further the class $\mathcal{C}(h)$. For the first time, the inequality in (3.3), treated as the univalence criterion, was distinguished explicitly in [20, p. 185]. For the class $\mathcal{C}(h)$, the upper bound of the Fekete-Szegö coefficient functional $\Phi_{\lambda}$ for $\lambda \in \mathbb{R}$ was recently obtained in [14, where the following result was proven.

Theorem 2. It is asserted that

$$
\max _{f \in \mathcal{C}(h)} \Phi_{\lambda}(f) \leqslant \begin{cases}\left|\frac{1}{3}-\frac{1}{4} \lambda\right|+\frac{2}{3}|2-3 \lambda| & \left(\lambda \in\left(-\infty, \frac{2}{9}\right] \cup\left[\frac{10}{9}, \infty\right)\right)  \tag{3.4}\\ \frac{1}{12} \cdot \frac{(2-3 \lambda)^{2}}{2-|2-3 \lambda|}+\left|\frac{1}{3}-\frac{1}{4} \lambda\right|+\frac{2}{3} & \left(\lambda \in\left[\frac{2}{9}, \frac{10}{9}\right]\right) .\end{cases}
$$

For each $\lambda \in\left(-\infty, \frac{2}{3}\right] \cup\left[\frac{4}{3}, \infty\right)$, the inequality is sharp and the equality in (22) is attained by a function in $\mathcal{C}_{0}(h)$.

Remark 2. For $\lambda \in\left(-\infty, \frac{2}{3}\right] \cup\left[\frac{4}{3}, \infty\right)$, we can rewrite (3.4) as the following corollary.

Corollary 1. The following assertion holds true:

$$
\max _{f \in \mathcal{C}(h)} \Phi_{\lambda}(f)= \begin{cases}\left|\frac{5}{3}-\frac{9 \lambda}{4}\right| & \left(\lambda \in\left(-\infty, \frac{2}{9}\right] \cup\left[\frac{4}{3}, \infty\right)\right)  \tag{3.5}\\ \frac{2}{3}+\frac{1}{9 \lambda} & \left(\lambda \in\left[\frac{2}{9}, \frac{2}{3}\right]\right)\end{cases}
$$

Remark 3. For $\lambda \in\left[0, \frac{2}{3}\right]$, the result (3.5) asserted by Corollary 3.5 coincides with (3.1). Thus, naturally, Theorem 1 and Theorem 2 yield Corollary 2 below.

Corollary 2. Each of the following assertions holds true:

$$
\begin{array}{ll}
\max _{f \in \mathcal{C}(h)} \Phi_{\lambda}(f)=\max _{f \in \mathcal{C}_{0}^{c}} \Phi_{\lambda}(f)=\max _{f \in \mathcal{C}^{c}} \Phi_{\lambda}(f) & \left(\lambda \in\left[0, \frac{2}{3}\right]\right), \\
\max _{f \in \mathcal{C}(h)} \Phi_{\lambda}(f) \leqslant \frac{9 \lambda^{2}-30 \lambda+26}{6(4-3 \lambda)} \leqslant \frac{5}{6} & \left(\lambda \in\left(\frac{2}{3}, 1\right]\right) .
\end{array}
$$

REmark 4. The maximum of $\Phi_{\lambda}$ for $\lambda \in\left[0, \frac{2}{3}\right]$, over the class $\mathcal{C}^{c}$ of close-to-convex functions with respect to convex functions and over its subclass $\mathcal{C}(h)$ of close-to-convex functions with respect to convex function $h$, are identical.

Remark 5. The sharpness of the inequality in (3.4) for $\lambda \in\left(\frac{2}{3}, \frac{4}{3}\right)$ is an open problem.

Remark 6. We reiterate the fact that the Fekete-Szegö coefficient functional $\left|a_{3}-\lambda a_{2}^{2}\right|$ is well known for its rich history in geometric function theory. Its origin was in the disproof by Fekete and Szegö [4] of the 1933 conjecture of Littlewood and Paley that the coefficients of odd univalent functions are bounded by unity (see, for details, 4]). The $\lambda$-generalized Fekete-Szegö coefficient functional $\left|a_{3}-\lambda a_{2}^{2}\right|$ has since received great attention, particularly in connection with many subclasses of the class $\mathcal{S}$ of normalized analytic and univalent functions. On the other hand, in the year 1976, Noonan and Thomas [17] defined the $\mathfrak{q t h}$ Hankel determinant of
the function $f$ in (1.2) by

$$
H_{\mathfrak{q}}(n)=\left|\begin{array}{cccc}
a_{n} & a_{n+1} & \cdots & a_{n+\mathfrak{q}-1} \\
a_{n+1} & a_{n+2} & \cdots & a_{n+\mathfrak{q}} \\
\vdots & \vdots & \vdots & \vdots \\
a_{n+\mathfrak{q}-1} & a_{n+\mathfrak{q}} & \cdots & a_{n+2 \mathfrak{q}-2}
\end{array}\right| \quad\left(n, \mathfrak{q} \in \mathbb{N} ; a_{1}:=1\right)
$$

The determinant $H_{\mathfrak{q}}(n)$ has also been considered by several other authors. For example, Noor [18] determined the rate of growth of $H_{\mathfrak{q}}(n)$ as $n \rightarrow \infty$ for functions $f$ given by (1.1) with bounded boundary. In particular, sharp upper bounds on $H_{2}(2)$ were obtained in the recent works $\mathbf{7}, \mathbf{1 8}$, for different classes of functions. We note, in particular, that

$$
H_{2}(1)=\left|\begin{array}{ll}
a_{1} & a_{2} \\
a_{2} & a_{3}
\end{array}\right|=a_{3}-a_{2}^{2} \quad \text { and } \quad H_{2}(2)=\left|\begin{array}{ll}
a_{2} & a_{3} \\
a_{3} & a_{4}
\end{array}\right|=a_{2} a_{4}-a_{3}^{2}
$$

The Hankel determinant $H_{2}(1)=a_{3}-a_{2}^{2}$ is the classical Fekete-Szegö coefficient functional. The upper bounds of $H_{2}(2)$ for some specific analytic function classes were discussed quite recently by Deniz et al. [3] (see also [19]).
