

SOME INSIGHTS ON BICATEGORIES OF FRACTIONS: REPRESENTATIONS AND COMPOSITIONS OF 2-MORPHISMS

MATTEO TOMMASINI

ABSTRACT. In this paper we investigate the construction of bicategories of fractions originally described by D. Pronk: given any bicategory \mathcal{C} together with a suitable class of morphisms \mathbf{W} , one can construct a bicategory $\mathcal{C}[\mathbf{W}^{-1}]$, where all the morphisms of \mathbf{W} are turned into internal equivalences, and that is universal with respect to this property. Most of the descriptions leading to this construction were long and heavily based on the axiom of choice. In this paper we considerably simplify the description of the equivalence relation on 2-morphisms and the constructions of associators, vertical and horizontal compositions in $\mathcal{C}[\mathbf{W}^{-1}]$, thus proving that the axiom of choice is not needed under certain conditions. The simplified description of associators and compositions will also play a crucial role in two forthcoming papers about pseudofunctors and equivalences between bicategories of fractions.

1. Introduction

In [P1996] Dorette Pronk introduced the notion of (*right*) *bicalculus of fractions*, generalizing to the framework of bicategories the concept of (right) calculus of fractions, originally described by Pierre Gabriel and Michel Zisman in [GZ1967] in the framework of categories. To be more precise, given any bicategory \mathcal{C} and any class \mathbf{W} of 1-morphisms in it, one considers the following set of axioms:

(BF1): for every object A of \mathcal{C} , the 1-identity id_A belongs to \mathbf{W} ;

(BF2): \mathbf{W} is closed under compositions;

I would like to thank Dorette Pronk for several interesting discussions about her work on bicategories of fractions, and for some useful suggestions about this paper. I am also very thankful to the anonymous referee for carefully reading the first version of this paper, and for lots of useful suggestions, in particular for pointing out that Lemmas 3.1, 3.2 and 3.4 could be used as a foundational part of this work, instead of being only described as a side result at the end of the paper (compare with the previous version of this work at <http://arxiv.org/abs/1410.3990v2>). I am also grateful to Stefano Maggiolo for his program *Commu*: it provides a simple interface for shortening the construction of diagrams with the package *tikz*. If you are interested, you can download it for free from <http://poisson.phc.unipi.it/~maggiolo/Software/commu/> (only for Linux distributions and Mac). This research was mainly performed at the Mathematics Research Unit of the University of Luxembourg, thanks to the grant 4773242 by Fonds National de la Recherche Luxembourg.

(BF3): for every morphism $w : A \rightarrow B$ in \mathbf{W} and for every morphism $f : C \rightarrow B$, there are an object D , a morphism $w' : D \rightarrow C$ in \mathbf{W} , a morphism $f' : D \rightarrow A$ and an invertible 2-morphism $\alpha : f \circ w' \Rightarrow w \circ f'$;

(BF4): (a) given any morphism $w : B \rightarrow A$ in \mathbf{W} , any pair of morphisms $f^1, f^2 : C \rightarrow B$ and any 2-morphism $\alpha : w \circ f^1 \Rightarrow w \circ f^2$, there are an object D , a morphism $v : D \rightarrow C$ in \mathbf{W} and a 2-morphism $\beta : f^1 \circ v \Rightarrow f^2 \circ v$, such that the following two compositions are equal:

$$\begin{array}{ccc}
 D & \xrightarrow{v} & C \\
 & & \swarrow f^1 \\
 & & B \\
 & & \searrow f^2 \\
 & & C \\
 & & \swarrow f^1 \\
 & & B \\
 & & \searrow f^2 \\
 & & C
 \end{array}
 \begin{array}{c}
 \Downarrow \alpha \\
 \Downarrow \alpha
 \end{array}
 \begin{array}{ccc}
 B & \xrightarrow{w} & A \\
 & & \swarrow f^1 \\
 & & B \\
 & & \searrow f^2 \\
 & & C
 \end{array}$$

(b) if α in (a) is invertible, then so is β ;

(c) if $(D', v' : D' \rightarrow C, \beta' : f^1 \circ v' \Rightarrow f^2 \circ v')$ is another triple with the same properties as (D, v, β) in (a), then there are an object E , a pair of morphisms $u : E \rightarrow D$ and $u' : E \rightarrow D'$, and an invertible 2-morphism $\zeta : v \circ u \Rightarrow v' \circ u'$, such that $v \circ u$ belongs to \mathbf{W} and the following two compositions are equal:

$$\begin{array}{ccc}
 E & \xrightarrow{u} & D \\
 & & \swarrow v \\
 & & C \\
 & & \searrow f^1 \\
 & & B \\
 & & \swarrow f^2 \\
 & & C
 \end{array}
 \begin{array}{c}
 \Downarrow \zeta \\
 \Downarrow \zeta
 \end{array}
 \begin{array}{ccc}
 D & \xrightarrow{v'} & C \\
 & & \swarrow v' \\
 & & C \\
 & & \searrow f^2 \\
 & & C
 \end{array}
 \begin{array}{c}
 \Downarrow \beta' \\
 \Downarrow \beta'
 \end{array}
 \begin{array}{ccc}
 C & \xrightarrow{f^1} & B \\
 & & \swarrow f^1 \\
 & & B \\
 & & \searrow f^2 \\
 & & C
 \end{array}$$

(BF5): if $w : A \rightarrow B$ is a morphism in \mathbf{W} , $v : A \rightarrow B$ is any morphism and if there is an invertible 2-morphism $v \Rightarrow w$, then also v belongs to \mathbf{W} .

For simplicity of exposition, in axioms (BF4a) and (BF4c) we omitted the associators of \mathcal{C} . Also in the rest of this paper we will omit all the associators of \mathcal{C} , as well as the right and left unitors (except for the few cases where we cannot ignore them discussing coherence results); the interested reader can easily complete the proofs with the missing associators and unitors (by coherence, any two ways of filling a diagram of \mathcal{C} with such 2-morphisms will give the same result). In particular, *each statement in the rest of this paper (except Corollaries 4.4 and 8.1) is given without mentioning the associators of \mathcal{C} , (as if \mathcal{C} is a 2-category), but holds also when \mathcal{C} is simply a bicategory.*

A pair $(\mathcal{C}, \mathbf{W})$ is said to *admit a (right) bicalculus of fractions* if all the axioms (BF) are satisfied (actually in [P1996, § 2.1] condition (BF1) is slightly more restrictive than the version stated above, but it is not necessary for any of the constructions in that paper). Under these conditions, Pronk proved that there are a bicategory $\mathcal{C}[\mathbf{W}^{-1}]$ (called (*right*)

bicategory of fractions) and a pseudofunctor $\mathcal{U}_{\mathbf{W}} : \mathcal{C} \rightarrow \mathcal{C}[\mathbf{W}^{-1}]$, satisfying a universal property (see [P1996, Theorem 21]). In order to describe the main results of this paper, we need to recall briefly the construction of $\mathcal{C}[\mathbf{W}^{-1}]$ as described in [P1996, § 2].

The objects of $\mathcal{C}[\mathbf{W}^{-1}]$ are the same as those of \mathcal{C} . A morphism from A to B in $\mathcal{C}[\mathbf{W}^{-1}]$ is any triple (A', w, f) , where A' is an object of \mathcal{C} , $w : A' \rightarrow A$ is an element of \mathbf{W} and $f : A' \rightarrow B$ is a morphism of \mathcal{C} . In order to compose such triples, we need to fix the following set of choices:

$\mathbf{C}(\mathbf{W})$: for every set of data in \mathcal{C} as follows

$$A' \xrightarrow{f} B \xleftarrow{v} B' \tag{1}$$

with v in \mathbf{W} , using axiom (BF3) we *choose* an object A'' , a pair of morphisms v' in \mathbf{W} and f' , and an invertible 2-morphism ρ in \mathcal{C} , as follows:

$$\begin{array}{ccc} & A'' & \\ v' \swarrow & \rho & \searrow f' \\ A' \xrightarrow{f} B & \xleftarrow{v} & B'. \end{array} \tag{2}$$

Then, given any pair of morphisms from A to B and from B to C in $\mathcal{C}[\mathbf{W}^{-1}]$ as follows

$$\underline{f} := \left(A \xleftarrow{w} A' \xrightarrow{f} B \right) \quad \text{and} \quad \underline{g} := \left(B \xleftarrow{v} B' \xrightarrow{g} C \right) \tag{3}$$

(with both w and v in \mathbf{W}), one has to use the choice for the pair (f, v) in the set $\mathbf{C}(\mathbf{W})$, in order to get data as in (2); after having done that, one sets $\underline{g} \circ \underline{f} := (A'', w \circ v', g \circ f')$.

Since axiom (BF3) does not ensure uniqueness in general, the set of choices $\mathbf{C}(\mathbf{W})$ in general is not unique; therefore different sets of choices give rise to different compositions of morphisms, hence to different bicategories of fractions. Such different bicategories are equivalent by [P1996, Theorem 21] (using the axiom of choice).

Given any pair of objects A, B and any pair of morphisms $(A^m, w^m, f^m) : A \rightarrow B$ for $m = 1, 2$ in $\mathcal{C}[\mathbf{W}^{-1}]$, a 2-morphism from (A^1, w^1, f^1) to (A^2, w^2, f^2) is an equivalence

class of data $(A^3, v^1, v^2, \alpha, \beta)$ in \mathcal{C} as follows

$$\begin{array}{ccccc}
 & & A^1 & & \\
 & \swarrow w^1 & \uparrow v^1 & \searrow f^1 & \\
 A & & A^3 & & B, \\
 & \swarrow w^2 & \downarrow v^2 & \searrow f^2 & \\
 & & A^2 & &
 \end{array}
 \tag{4}$$

such that $w^1 \circ v^1$ belongs to \mathbf{W} and such that α is invertible in \mathcal{C} (in [P1996, § 2.3] it is also required that $w^2 \circ v^2$ belongs to \mathbf{W} , but this follows from (BF5)). Any other set of data

$$\begin{array}{ccccc}
 & & A^1 & & \\
 & \swarrow w^1 & \uparrow v'^1 & \searrow f^1 & \\
 A & & A'^3 & & B \\
 & \swarrow w^2 & \downarrow v'^2 & \searrow f^2 & \\
 & & A^2 & &
 \end{array}
 \tag{5}$$

(such that $w^1 \circ v'^1$ belongs to \mathbf{W} and α' is invertible) represents the same 2-morphism in $\mathcal{C}[\mathbf{W}^{-1}]$ if and only if there is a set of data $(A^4, z, z', \sigma^1, \sigma^2)$ in \mathcal{C} as in the following diagram

$$\begin{array}{ccccc}
 & & A^1 & & \\
 & \swarrow v'^1 & \sigma^1 & \searrow v^1 & \\
 & & \Rightarrow & & \\
 A'^3 & \xleftarrow{z'} & A^4 & \xrightarrow{z} & A^3, \\
 & \searrow v'^2 & \sigma^2 & \swarrow v^2 & \\
 & & A^2 & &
 \end{array}
 \tag{6}$$

such that:

- $w^1 \circ v^1 \circ z$ belongs to \mathbf{W} ;
- σ^1 and σ^2 are both invertible;

Having fixed also this additional set of choices, the descriptions of associators and vertical/horizontal compositions in [P1996] are very long and they do not allow much freedom on some additional choices that are done at each step of the construction (see the explicit descriptions in the next pages). Different sets of choices $\mathbf{D}(\mathbf{W})$ (with a fixed set of choices $\mathbf{C}(\mathbf{W})$) might appear to lead to different bicategories of fractions, having the same objects, morphisms, 2-morphisms and unitors, but (a priori) different associators and vertical/horizontal compositions. The bicategories obtained with different sets of choices $\mathbf{D}(\mathbf{W})$ (with a fixed set of choices $\mathbf{C}(\mathbf{W})$) are obviously *equivalent* (using the already mentioned [P1996, Theorem 21]), but one cannot get better results using only the statements of [P1996].

In this paper we will prove that *the choices $\mathbf{D}(\mathbf{W})$ are actually not necessary* because different sets of choices $\mathbf{D}(\mathbf{W})$ (with a fixed set of choices $\mathbf{C}(\mathbf{W})$) give *the same* bicategory of fractions instead of simply equivalent ones. In the process of proving this fact, we will also considerably simplify the descriptions of associators and vertical/horizontal compositions in $\mathcal{C}[\mathbf{W}^{-1}]$, thus providing a useful set of tools for explicit computations in any bicategory of fractions.

In order to prove these results, we will first need a simple way of comparing (representatives of) associators and vertical/horizontal compositions induced by different sets of choices $\mathbf{D}(\mathbf{W})$. More generally, since the current way of comparing representatives of 2-morphisms (based on the existence of a set of data $(A^4, z, z', \sigma^1, \sigma^2)$) is too long, we will prove (and then use) the following comparison result for any pair of 2-morphisms with the same source and target in $\mathcal{C}[\mathbf{W}^{-1}]$.

1.1. PROPOSITION. (comparison of 2-morphisms in $\mathcal{C}[\mathbf{W}^{-1}]$) *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF), any pair of objects A, B , any pair of morphisms $\underline{f}^m := (A^m, w^m, f^m) : A \rightarrow B$ for $m = 1, 2$ and any pair of 2-morphisms $\Gamma, \Gamma' : \underline{f}^1 \Rightarrow \underline{f}^2$ in $\mathcal{C}[\mathbf{W}^{-1}]$. Then there are an object A^3 , a morphism $v^1 : A^3 \rightarrow A^1$ in \mathbf{W} , a morphism $v^2 : A^3 \rightarrow A^2$, an invertible 2-morphism $\alpha : w^1 \circ v^1 \Rightarrow w^2 \circ v^2$ and a pair of 2-morphisms $\gamma, \gamma' : f^1 \circ v^1 \Rightarrow f^2 \circ v^2$, such that:*

$$\Gamma = [A^3, v^1, v^2, \alpha, \gamma] \quad \text{and} \quad \Gamma' = [A^3, v^1, v^2, \alpha, \gamma']. \quad (10)$$

In other words, given any pair of 2-morphisms with the same source and target in $\mathcal{C}[\mathbf{W}^{-1}]$, they admit representatives which only differ (possibly) in the last variable. Moreover, given any pair of 2-morphisms $\Gamma, \Gamma' : \underline{f}^1 \Rightarrow \underline{f}^2$ with representatives satisfying (10), the following facts are equivalent:

- (i) $\Gamma = \Gamma'$;
- (ii) *there are an object A^4 and a morphism $z : A^4 \rightarrow A^3$ in \mathbf{W} , such that $\gamma \circ z = \gamma' \circ z$;*
- (iii) *there are an object A^4 and a morphism $z : A^4 \rightarrow A^3$, such that $v^1 \circ z$ belongs to \mathbf{W} and such that $\gamma \circ z = \gamma' \circ z$.*

This result implies that the universal pseudofunctor $\mathcal{U}_{\mathbf{W}} : \mathcal{C} \rightarrow \mathcal{C}[\mathbf{W}^{-1}]$ mentioned above in general is not 2-full, neither 2-faithful, but only 2-full and 2-faithful “modulo morphisms of \mathbf{W} ” (for more details, see Remark 3.5).

Using Proposition 1.1 we will show some simple procedures (still long, but shorter than the original ones in [P1996]) in order to compute:

- (i) **the associators of $\mathcal{C}[\mathbf{W}^{-1}]$** : in Proposition 4.1 we show how to compute associators in a way that does not depend on the set of choices $\mathbf{D}(\mathbf{W})$;
- (ii) **vertical composition of 2-morphisms**: in Proposition 5.1 we will prove that this construction does not depend on the set of choices $\mathbf{C}(\mathbf{W})$ nor on the set of choices $\mathbf{D}(\mathbf{W})$. In other words, vertical compositions are the same in *any* bicategory of fractions for $(\mathcal{C}, \mathbf{W})$ (a priori we only knew that objects, morphisms, 2-morphisms and unitors are the same in any bicategory of fractions for $(\mathcal{C}, \mathbf{W})$);
- (iii) **horizontal composition of 2-morphisms with 1-morphisms** on the left (Proposition 6.1) and on the right (Proposition 7.1): in both cases we will prove that the composition does not depend on the set of choices $\mathbf{D}(\mathbf{W})$.

We omit here the precise statements of the four propositions mentioned above since they are rather long and technical. Note that the explicit construction of *representatives* for associators and vertical/horizontal compositions in a bicategory of fractions will still depend:

- on a choice of representatives for the 2-morphisms that we want to compose (in Propositions 5.1, 6.1 and 7.1);
- on some additional choices of data of \mathcal{C} (these are the choices called (F1) – (F10) in the next sections).

However, any two representatives (for an associator or a vertical/horizontal composition), even if they are constructed in different ways and hence appear different, are actually representatives for *the same* 2-morphism. If you need to use the constructions described in Propositions 4.1, 5.1, 6.1 or 7.1 for associators and vertical/horizontal compositions but you don’t remember the precise statements, the general philosophy behind all such results is the following:

- (a) firstly, you have to use the set of choices $\mathbf{C}(\mathbf{W})$ in order to construct the compositions on the level of 1-morphisms of $\mathcal{C}[\mathbf{W}^{-1}]$ (see (3));
- (b) now you need to construct a representative of a 2-morphism between the morphisms constructed in (a). If you need to compute associators, jump to point (c) below; if you need to compute compositions of the form (ii) and (iii), then the diagram that you want to construct can be partially filled with 2-morphisms of \mathcal{C} , coming from any chosen representatives for the 2-morphisms that we are composing;

- (c) the missing “holes” in the diagram that you are constructing can be filled using axioms (BF3) and (BF4) finitely many times (an example of such an iterative procedure can be found in the remarks following each proposition mentioned above);
- (d) in general, axioms (BF3) and (BF4) do not ensure uniqueness: in (c) you might get different “fillings” for the holes, and hence different diagrams. The results in Propositions 4.1, 5.1, 6.1 and 7.1 ensure that different choices in (b) and (c) induce diagrams representing *the same 2-morphism* in $\mathcal{C}[\mathbf{W}^{-1}]$. So you do not have to worry about the choices made above: you simply take the equivalence class of the diagram that you constructed, and you are done.

Each horizontal composition in any bicategory can be obtained as a suitable combination of compositions of the form (ii) and (iii). Thus Propositions 5.1, 6.1 and 7.1 prove immediately that *horizontal compositions in $\mathcal{C}[\mathbf{W}^{-1}]$ do not depend on the set of choices $\mathbf{D}(\mathbf{W})$* . This, together with (i) and (ii), implies at once the main result of this paper:

1.2. **THEOREM. (the structure of $\mathcal{C}[\mathbf{W}^{-1}]$)** *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF). Then the construction of $\mathcal{C}[\mathbf{W}^{-1}]$ depends only on the set of choices $\mathbf{C}(\mathbf{W})$, i.e., different sets of choices $\mathbf{C}(\mathbf{W})$ (for any fixed set of choices $\mathbf{C}(\mathbf{W})$) give the same bicategory of fractions, instead of only equivalent ones.*

In particular, we get immediately:

1.3. **COROLLARY.** *Let us suppose that for each pair (f, v) with v in \mathbf{W} as in (1) there is a unique choice of (A'', v', f', ρ) as in $\mathbf{C}(\mathbf{W})$. Then the construction of $\mathcal{C}[\mathbf{W}^{-1}]$ does not depend on the axiom of choice. The same result holds if “unique choice” above is replaced by “canonical choice” (i.e., when there is a canonical choice of pullback diagrams or iso comma squares for axiom (BF3)).*

In Section 8 we will show some explicit applications of the results mentioned so far. In particular, we will describe a simple procedure for checking the invertibility of a 2-morphism in any bicategory of fractions:

1.4. **PROPOSITION. (invertibility of 2-morphisms in $\mathcal{C}[\mathbf{W}^{-1}]$)** *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF), any pair of morphisms $\underline{f}^m := (A^m, w^m, f^m) : A \rightarrow B$ in $\mathcal{C}[\mathbf{W}^{-1}]$ for $m = 1, 2$ and any 2-morphism $\Gamma : \underline{f}^1 \Rightarrow \underline{f}^2$. Then the following facts are equivalent:*

- (i) Γ is invertible in $\mathcal{C}[\mathbf{W}^{-1}]$;
- (ii) Γ has a representative as in (4), such that β is invertible in \mathcal{C} ;
- (iii) given any representative (4) for Γ , there are an object A^4 and a morphism $u : A^4 \rightarrow A^3$ in \mathbf{W} , such that $\beta \circ u$ is invertible in \mathcal{C} ;
- (iv) given any representative (4) for Γ , there are an object A^4 and a morphism $u : A^4 \rightarrow A^3$, such that $v^1 \circ u$ belongs to \mathbf{W} and such that $\beta \circ u$ is invertible in \mathcal{C} .

Note that in (4) α is always invertible by the definition of 2-morphism in $\mathcal{C}[\mathbf{W}^{-1}]$.

As another application, we obtain a nice description of some associators in $\mathcal{C}[\mathbf{W}^{-1}]$ in terms of the associators in the original bicategory \mathcal{C} . For the precise statement we refer directly to Corollary 8.1.

We are going to apply all the results mentioned so far in the next two papers [T2014(a)] and [T2014(b)], where we will investigate the problem of constructing pseudofunctors and equivalences between bicategories of fractions.

In the Appendix of this paper we will give an alternative description of 2-morphisms in any bicategory of fraction, inspired by the results of Proposition 1.1. This alternative description is not further exploited in this paper since it does not interact well with vertical and horizontal compositions; it does seem interesting for other purposes as it is considerably simpler than the description given above: instead of having classes of equivalence where each representative is a collection of 5 data $(A^3, v^1, v^2, \alpha, \beta)$ as in (4), we have classes of equivalence where each representative is a collection of 3 data of \mathcal{C} . In addition, the equivalence relation in this alternative description is much simpler than the one recalled above.

2. Notations and basic lemmas

We mainly refer to [L] and [PW, § 1] for a general overview on bicategories, pseudofunctors (i.e., homomorphisms of bicategories), lax natural transformations and modifications. For simplicity of exposition, each composition of 1-morphisms and 2-morphisms will be denoted by \circ , both in \mathcal{C} and in $\mathcal{C}[\mathbf{W}^{-1}]$.

In the rest of this paper we will often use the following four easy lemmas. Even if each of them is not difficult for experts in this area, they may be harder for inexperienced readers; so we give a detailed proof for each of them.

2.1. LEMMA. *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF). Let us fix any morphism $w : B \rightarrow A$ in \mathbf{W} , any pair of morphisms $f^1, f^2 : C \rightarrow B$ and any pair of 2-morphisms $\gamma, \gamma' : f^1 \Rightarrow f^2$, such that $w \circ \gamma = w \circ \gamma'$. Then there are an object E and a morphism $u : E \rightarrow C$ in \mathbf{W} , such that $\gamma \circ u = \gamma' \circ u$.*

PROOF. We set:

$$\alpha := w \circ \gamma : w \circ f^1 \Longrightarrow w \circ f^2.$$

Then condition (BF4a) is obviously satisfied by the set of data:

$$D := C, \quad v := \text{id}_C, \quad \beta := \gamma : f^1 \circ v \Longrightarrow f^2 \circ v.$$

Since we have also $\alpha = w \circ \gamma'$ by hypothesis, (BF4a) is also satisfied by the data:

$$D' := C, \quad v' := \text{id}_C, \quad \beta' := \gamma' : f^1 \circ v' \Rightarrow f^2 \circ v'.$$

Then by (BF4c) there are an object E , a pair of morphisms $u, u' : E \rightarrow C$ (with u in \mathbf{W}) and an invertible 2-morphism $\zeta : u \Rightarrow u'$, such that:

$$(\gamma' \circ u') \circ (f^1 \circ \zeta) = (f^2 \circ \zeta) \circ (\gamma \circ u).$$

Using the coherence axioms on the bicategory \mathcal{C} and the fact that ζ is invertible, this implies that $\gamma \circ u = \gamma' \circ u$. ■

The next two lemmas prove that if conditions (BF) hold, then conditions (BF3), (BF4a) and (BF4b) hold under less restrictive conditions on the morphism w . To be more precise, instead of imposing that w belongs to \mathbf{W} , it is sufficient to impose that $z \circ w$ belongs to \mathbf{W} for some morphism z in \mathbf{W} (as a special case, one gets back again (BF3), (BF4a) and (BF4b) when we choose z as a 1-identity).

2.2. LEMMA. *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF). Let us choose any quadruple of objects A, B, B', C and any triple of morphisms $w : A \rightarrow B$, $z : B \rightarrow B'$ and $f : C \rightarrow B$, such that both z and $z \circ w$ belong to \mathbf{W} . Then there are an object D , a morphism w' in \mathbf{W} , a morphism f' and an invertible 2-morphism α as follows:*

$$\begin{array}{ccccc} D & \xrightarrow{f'} & A & & \\ w' \downarrow & \nearrow \alpha & \downarrow w & & \\ C & \xrightarrow{f} & B & \xrightarrow{z} & B'. \end{array}$$

PROOF. Since $z \circ w$ belongs to \mathbf{W} , we can apply axiom (BF3) to the pair of morphisms $(z \circ f, z \circ w)$, so we get an object E , a morphism $t : E \rightarrow C$ in \mathbf{W} , a morphism $g : E \rightarrow A$ and an invertible 2-morphism $\gamma : z \circ f \circ t \Rightarrow z \circ w \circ g$. Since z belongs to \mathbf{W} , we can apply (BF4a) and (BF4b) to the invertible 2-morphism γ . So there are an object D , a morphism $r : D \rightarrow E$ in \mathbf{W} and an invertible 2-morphism $\alpha : f \circ t \circ r \Rightarrow w \circ g \circ r$, such that $\gamma \circ r = z \circ \alpha$. Then we set $f' := g \circ r : D \rightarrow A$ and $w' := t \circ r : D \rightarrow C$; this last morphism belongs to \mathbf{W} by construction and (BF2). This suffices to conclude. ■

2.3. LEMMA. *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF). Let us choose any quadruple of objects A, A', B, C and any quadruple of morphisms $w : B \rightarrow A$, $z : A \rightarrow A'$ and $f^1, f^2 : C \rightarrow B$, such that both z and $z \circ w$ belong to \mathbf{W} . Moreover, let us fix any 2-morphism $\alpha : w \circ f^1 \Rightarrow w \circ f^2$. Then there are an object D , a morphism $v : D \rightarrow C$ in \mathbf{W} and a 2-morphism $\beta : f^1 \circ v \Rightarrow f^2 \circ v$, such that $\alpha \circ v = w \circ \beta$. Moreover, if α is invertible, so is β .*

$$\begin{array}{ccc}
 D \xrightarrow{v} C & \begin{array}{c} \nearrow f^1 \\ \Downarrow \alpha \\ \searrow f^2 \end{array} & \begin{array}{c} B \\ \xrightarrow{w} \\ A \end{array} \dashrightarrow A' \\
 & & \nearrow w \\
 & & B
 \end{array}, \quad \begin{array}{ccc}
 D & \begin{array}{c} \nearrow v \\ \Downarrow \beta \\ \searrow v \end{array} & \begin{array}{c} C \\ \xrightarrow{f^1} \\ B \end{array} \xrightarrow{w} A \dashrightarrow A' \\
 & & \nearrow f^2 \\
 & & C
 \end{array}$$

PROOF. Since $z \circ w$ belongs to \mathbf{W} , we can apply (BF4a) to the 2-morphism

$$z \circ \alpha : (z \circ w) \circ f^1 \Longrightarrow (z \circ w) \circ f^2.$$

So there are an object E , a morphism $t : E \rightarrow C$ in \mathbf{W} and a 2-morphism $\gamma : f^1 \circ t \Rightarrow f^2 \circ t$, such that:

$$z \circ \alpha \circ t = z \circ w \circ \gamma.$$

Since z belongs to \mathbf{W} , by Lemma 2.1 there are an object D and a morphism $r : D \rightarrow E$ in \mathbf{W} , such that:

$$\alpha \circ t \circ r = w \circ \gamma \circ r. \quad (11)$$

Then we define $v := t \circ r : D \rightarrow C$; this morphism belongs to \mathbf{W} by construction and (BF2). Moreover, we set $\beta := \gamma \circ r : f^1 \circ v \Rightarrow f^2 \circ v$. Then from (11) we get that $\alpha \circ v = w \circ \beta$. Moreover, if α is invertible, then by (BF4b) so is γ , hence so is β . ■

2.4. LEMMA. *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF), any triple of objects A, B, C and any pair of morphisms $w : C \rightarrow B$ and $z : B \rightarrow A$, such that both z and $z \circ w$ belong to \mathbf{W} . Then there are an object D and a morphism v as below, such that $w \circ v$ belongs to \mathbf{W} :*

$$D \xrightarrow{v} C \xrightarrow{w} B \xrightarrow{z} A.$$

PROOF. First of all, we apply axiom (BF3) on the pair $(z, z \circ w)$. Since $z \circ w$ belongs to \mathbf{W} by hypothesis, there are an object R , a morphism p in \mathbf{W} , a morphism q and an invertible 2-morphism α as below:

$$\begin{array}{ccc}
 & R & \\
 p \swarrow & & \searrow q \\
 B & \xrightarrow{\alpha} & C \\
 \xrightarrow{z} & A & \xleftarrow{z \circ w}
 \end{array}$$

Now let us apply axioms (BF4a) and (BF4b) to the invertible 2-morphism $\alpha : z \circ p \Rightarrow z \circ (w \circ q)$. Since z belongs to \mathbf{W} by hypothesis, there are an object D , a morphism $r : D \rightarrow R$ in \mathbf{W} and an invertible 2-morphism $\beta : p \circ r \Rightarrow w \circ q \circ r$, such that $\alpha \circ r = z \circ \beta$.

By construction both p and r belong to \mathbf{W} , hence also $p \circ r$ belongs to \mathbf{W} by axiom (BF2). Since β is invertible, then by (BF5) we conclude that also $w \circ q \circ r$ belongs to \mathbf{W} . Then in order to conclude it suffices to define $v := q \circ r : D \rightarrow C$. ■

3. Comparison of 2-morphisms in a bicategory of fractions

In this section we are going to prove Proposition 1.1. First of all, we need the following lemma. In most of this paper this result will be applied with $A = A'$ and $z = \text{id}_A$, but we need to state it in this more general form since the presence of a non-trivial z will be crucial in a couple of points in the paper.

3.1. LEMMA. *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF), and any set of data as follows in \mathcal{C} , such that $z, z \circ w^1, z \circ w^2, z \circ w^1 \circ p$ and $z \circ w^1 \circ r$ all belong to \mathbf{W} , and such that ς and η are both invertible:*

Then there are:

- (1) a pair of objects G and A^3 ;
- (2) a morphism $t^1 : G \rightarrow E$, such that $p \circ t^1$ belongs to \mathbf{W} ;
- (3) a morphism $t^2 : G \rightarrow F$;
- (4) a morphism $t^3 : A^3 \rightarrow G$ in \mathbf{W} ;
- (5) a pair of invertible 2-morphisms ε and κ in \mathcal{C} as follows:

such that $\varsigma \circ t^1 \circ t^3$ is equal to the composition of the following diagram:

$$\begin{array}{ccccccc}
 & & G & \xrightarrow{t^1} & E & \xrightarrow{p} & A^1 \\
 & \nearrow^{t^3} & \downarrow \kappa & \searrow^{t^2} & \downarrow \varepsilon & \xrightarrow{r} & \downarrow \eta \\
 A^3 & \xrightarrow{t^3} & G & \xrightarrow{t^1} & E & \xrightarrow{s} & A^1 \\
 & & & & & \searrow^s & \downarrow \eta \\
 & & & & E & \xrightarrow{q} & A^2 \\
 & & & & & & \xrightarrow{w^2} & A.
 \end{array} \tag{12}$$

The choice of symbols in Lemma 3.1 may seem curious at first. It makes sense once we combine this lemma with Lemma 3.2 below.

PROOF. Step 1. First of all, let us prove the special case when $A = A'$ and $z = \text{id}_A$. In this case the hypotheses imply that $w^1, w^2, w^1 \circ p$ and $w^1 \circ r$ all belong to \mathbf{W} . Since both w^1 and $w^1 \circ p$ belong to \mathbf{W} , by Lemma 2.4 there are an object E' and a morphism $v : E' \rightarrow E$, such that $p \circ v$ belongs to \mathbf{W} .

Since both w^1 and $w^1 \circ r$ belong to \mathbf{W} , by Lemma 2.2 there are an object G , a morphism $\tilde{t}^1 : G \rightarrow E'$ in \mathbf{W} , a morphism $t^2 : G \rightarrow F$ and an invertible 2-morphism ε as follows:

$$\begin{array}{ccccc}
 & & G & & \\
 & \swarrow^{\tilde{t}^1} & & \searrow^{t^2} & \\
 E' & \xrightarrow{v} & E & \xrightarrow{p} & A^1 & \xleftarrow{r} & F.
 \end{array}$$

We set $t^1 := v \circ \tilde{t}^1 : G \rightarrow E$. By construction $p \circ v$ and \tilde{t}^1 both belong to \mathbf{W} ; so by (BF2) the morphism $p \circ t^1 = p \circ v \circ \tilde{t}^1$ belongs to \mathbf{W} , so condition (2) is verified.

By hypothesis and construction, both w^1 and $p \circ t^1$ belong to \mathbf{W} , hence $w^1 \circ p \circ t^1$ also belongs to \mathbf{W} . So using axiom (BF5) on the invertible 2-morphism

$$\varsigma^{-1} \circ t^1 : w^2 \circ q \circ t^1 \implies w^1 \circ p \circ t^1,$$

we get that $w^2 \circ q \circ t^1$ also belongs to \mathbf{W} . Since w^2 belongs to \mathbf{W} by hypothesis, using Lemma 2.2 we conclude that there are an object H , a morphism $z^1 : H \rightarrow G$ in \mathbf{W} , a morphism $z^2 : H \rightarrow G$ and an invertible 2-morphism ϕ as follows:

$$\begin{array}{ccccc}
 & & H & & \\
 & \swarrow^{z^1} & & \searrow^{z^2} & \\
 G & \xrightarrow{s \circ t^2} & A^2 & \xleftarrow{q \circ t^1} & G.
 \end{array}$$

Now let us denote by $\alpha : (w^2 \circ q \circ t^1) \circ z^2 \Rightarrow (w^2 \circ q \circ t^1) \circ z^1$ the following composition:

$$\begin{array}{ccccccc}
 H & \xrightarrow{z^2} & G & \xrightarrow{t^1} & E & \xrightarrow{q} & A^2 & \xrightarrow{w^2} & A \\
 & \searrow z^1 & \downarrow \phi^{-1} & & \downarrow \eta^{-1} & & & & \\
 & & G & \xrightarrow{t^2} & F & \xrightarrow{r} & A^1 & \xrightarrow{w^1} & A \\
 & & & \searrow t^1 & \downarrow \varepsilon^{-1} & & \downarrow \varsigma & & \\
 & & & & E & \xrightarrow{q} & A^2 & \xrightarrow{w^2} & A
 \end{array}
 \tag{13}$$

Since all the 2-morphisms above are invertible, so is α ; moreover we already said that $w^2 \circ q \circ t^1$ belongs to \mathbf{W} . Therefore using axioms (BF4a) and (BF4b) on α , we get an object A^3 , a morphism $z^3 : A^3 \rightarrow H$ in \mathbf{W} and an invertible 2-morphism $\beta : z^2 \circ z^3 \Rightarrow z^1 \circ z^3$, such that $\alpha \circ z^3 = (w^2 \circ q \circ t^1) \circ \beta$. The previous identity together with (13) implies that the following composition

$$\begin{array}{ccccccccccc}
 & & & & G & \xrightarrow{t^1} & E & \xrightarrow{p} & A^1 & \xrightarrow{w^1} & A \\
 & & & & \downarrow t^2 & & \downarrow \varepsilon & & \downarrow \eta & & \\
 & & & & H & \xrightarrow{z^1} & F & \xrightarrow{r} & A^1 & & \\
 & & & & \downarrow \beta & & \downarrow \phi & & \downarrow \eta & & \\
 A^3 & \xrightarrow{z^3} & H & \xrightarrow{z^2} & G & \xrightarrow{t^1} & E & \xrightarrow{q} & A^2 & \xrightarrow{w^2} & A \\
 & & & & \downarrow z^1 & & & & & &
 \end{array}
 \tag{14}$$

is equal to the following one:

$$A^3 \xrightarrow{z^3} H \xrightarrow{z^1} G \xrightarrow{t^1} E \begin{array}{l} \xrightarrow{p} A^1 \\ \xrightarrow{q} A^2 \end{array} \begin{array}{l} \xrightarrow{w^1} \\ \xrightarrow{w^2} \end{array} A.$$

Since both z^1 and z^3 belong to \mathbf{W} by construction, so does $t^3 := z^1 \circ z^3 : A^3 \rightarrow G$ by (BF2). Then in order to conclude it suffices to define κ as the composition of ϕ and β as on the left hand side of (14). So we have proved the lemma in the special case when $A = A'$ and $z = \text{id}_A$.

Step 2. Let us prove the general case: for that, we consider the diagrams:

$$\begin{array}{ccc}
 & & A^1 \\
 & \swarrow z \circ w^1 & \uparrow p \\
 A' & \xleftarrow{\text{id}_{A'}} A' & E \\
 & \searrow z \circ w^2 & \downarrow q \\
 & & A^2
 \end{array}
 \qquad
 \begin{array}{ccc}
 & & A^1 \\
 & \swarrow z \circ w^1 & \uparrow r \\
 A' & \xleftarrow{\text{id}_{A'}} A' & F \\
 & \searrow z \circ w^2 & \downarrow s \\
 & & A^2
 \end{array}$$

Using Step 1, there are:

- (1) a pair of objects G and \tilde{A}^3 ;
- (2) a morphism $t^1 : G \rightarrow E$, such that $p \circ t^1$ belongs to \mathbf{W} ;
- (3) a morphism $t^2 : G \rightarrow F$;
- (4) a morphism $\tilde{t}^3 : \tilde{A}^3 \rightarrow G$ in \mathbf{W} ;
- (5) a pair of invertible 2-morphisms ε and $\tilde{\kappa}$ in \mathcal{C} as follows:

$$\begin{array}{ccc}
 & G & \\
 t^1 \swarrow & & \searrow t^2 \\
 E & \xrightarrow{p} & A^1 \xleftarrow{r} F, \\
 & \xRightarrow{\varepsilon} & \\
 & &
 \end{array}
 \quad
 \begin{array}{ccc}
 & \tilde{A}^3 & \\
 \tilde{t}^3 \swarrow & & \searrow \tilde{t}^3 \\
 G & \xrightarrow{s \circ t^2} & A^2 \xleftarrow{q \circ t^1} G, \\
 & \xRightarrow{\tilde{\kappa}} &
 \end{array}$$

such that $z \circ \varsigma \circ t^1 \circ \tilde{t}^3$ is equal to the composition of the following diagram:

$$\begin{array}{ccccccc}
 & & G & \xrightarrow{t^1} & E & & \\
 & \tilde{t}^3 \nearrow & & & \downarrow \varepsilon & & \\
 & & & & F & \xrightarrow{r} & A^1 \\
 & & \downarrow \tilde{\kappa} & & & & \downarrow \eta \\
 \tilde{A}^3 & \xrightarrow{\tilde{t}^3} & G & \xrightarrow{t^1} & E & \xrightarrow{q} & A^2 \xrightarrow{w^2} A \xrightarrow{z} A'. \\
 & & & & \downarrow s & & \downarrow w^1
 \end{array}$$

Since z belongs to \mathbf{W} by hypothesis, we can apply Lemma 2.1 to the previous identity. So there are an object A^3 and a morphism $u : A^3 \rightarrow \tilde{A}^3$ in \mathbf{W} , such that $\varsigma \circ t^1 \circ \tilde{t}^3 \circ u$ coincides with the following composition:

$$\begin{array}{ccccccc}
 & & G & \xrightarrow{t^1} & E & & \\
 & \tilde{t}^3 \nearrow & & & \downarrow \varepsilon & & \\
 & & & & F & \xrightarrow{r} & A^1 \\
 & & \downarrow \tilde{\kappa} & & & & \downarrow \eta \\
 A^3 & \xrightarrow{u} & \tilde{A}^3 & \xrightarrow{\tilde{t}^3} & G & \xrightarrow{t^1} & E \xrightarrow{q} A^2 \xrightarrow{w^2} A. \\
 & & & & \downarrow s & & \downarrow w^1
 \end{array}$$

Then it suffices to set $t^3 := \tilde{t}^3 \circ u$ and $\kappa := \tilde{\kappa} \circ u$ in order to prove the general case. ■

3.2. LEMMA. *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF), any pair of objects A, B , any pair of morphisms $\underline{f}^m := (A^m, w^m, f^m) : A \rightarrow B$ for $m = 1, 2$, and any pair of 2-morphisms $\Gamma, \Gamma' : \underline{f}^1 \Rightarrow \underline{f}^2$ in $\mathcal{C}[\mathbf{W}^{-1}]$. Let us fix any representative $(E, p, q, \varsigma, \psi)$ for Γ and (F, r, s, η, μ) for Γ' as follows:*

$$\begin{array}{ccc}
 & A^1 & \\
 w^1 \swarrow & \uparrow p & \searrow f^1 \\
 A & E & B \\
 \downarrow \varsigma & & \downarrow \psi \\
 & A^2 & \\
 w^2 \swarrow & \downarrow q & \searrow f^2
 \end{array}, \quad
 \begin{array}{ccc}
 & A^1 & \\
 w^1 \swarrow & \uparrow r & \searrow f^1 \\
 A & F & B \\
 \downarrow \eta & & \downarrow \mu \\
 & A^2 & \\
 w^2 \swarrow & \downarrow s & \searrow f^2
 \end{array}. \tag{15}$$

Let us fix any set of data (1) – (5) as in Lemma 3.1. Then Γ , respectively Γ' , has a representative as follows:

$$\begin{array}{ccc}
 & A^1 & \\
 w^1 \swarrow & \uparrow p \circ t^1 \circ t^3 & \searrow f^1 \\
 A & A^3 & B \\
 \downarrow \varsigma \circ t^1 \circ t^3 & & \downarrow \psi \circ t^1 \circ t^3 \\
 & A^2 & \\
 w^2 \swarrow & \downarrow q \circ t^1 \circ t^3 & \searrow f^2
 \end{array}, \quad
 \begin{array}{ccc}
 & A^1 & \\
 w^1 \swarrow & \uparrow p \circ t^1 \circ t^3 & \searrow f^1 \\
 A & A^3 & B \\
 \downarrow \varsigma \circ t^1 \circ t^3 & & \downarrow \varphi \\
 & A^2 & \\
 w^2 \swarrow & \downarrow q \circ t^1 \circ t^3 & \searrow f^2
 \end{array}, \tag{16}$$

where φ is the following composition:

$$\begin{array}{ccccccc}
 & & G & \xrightarrow{t^1} & E & & \\
 & & \searrow t^2 & & \downarrow \varepsilon & \xrightarrow{p} & A^1 \\
 & & & & F & \xrightarrow{r} & \\
 & & & & & \searrow s & \downarrow \mu \\
 A^3 & \xrightarrow{t^3} & G & \xrightarrow{t^1} & E & \xrightarrow{q} & A^2 \xrightarrow{f^2} B \\
 & & \downarrow \kappa & & & & \\
 & & & & & &
 \end{array}. \tag{17}$$

PROOF. Since \underline{f}^1 and \underline{f}^2 are morphisms in $\mathcal{C}[\mathbf{W}^{-1}]$, w^1 and w^2 belong to \mathbf{W} . Moreover, since Γ and Γ' are 2-morphisms in such a bicategory, $w^1 \circ p$ and $w^1 \circ r$ also belong to \mathbf{W} . So a set of data (1) – (5) as in Lemma 3.1 exists. Now we claim that:

- (a) the following two diagrams are equivalent, i.e., they represent the same 2-morphism of $\mathcal{C}[\mathbf{W}^{-1}]$:

(b) the following two diagrams are equivalent:

In order to prove such claims, let us consider the following set of data:

Then claim (a) follows at once using the set of data on the left hand side of (18) and from the description of 2-cells of $\mathcal{C}[\mathbf{W}^{-1}]$. Claim (b) follows easily using the set of data on the right hand side of (18) together with the identities of (12) and of (17). \blacksquare

3.3. COROLLARY. *Let us fix any pair of morphisms $\underline{f}^m := (A^m, w^m, f^m) : A \rightarrow B$ for $m = 1, 2$ and any 2-morphism $\Phi : \underline{f}^1 \Rightarrow \underline{f}^2$ in $\mathcal{C}[\mathbf{W}^{-1}]$. Moreover, let us fix any set of data in \mathcal{C} as follows*

such that $w^1 \circ p$ belongs to \mathbf{W} and ς is invertible. Then there are an object A^3 , a morphism $t : A^3 \rightarrow E$ such that $p \circ t$ belongs to \mathbf{W} , and a 2-morphism $\varphi : f^1 \circ p \circ t \Rightarrow f^2 \circ q \circ t$ in \mathcal{C} , such that Φ is represented by the following diagram:

PROOF. The proof follows the same ideas mentioned in the proof of Lemma 3.2 for $\Gamma' := \Phi$; it suffices to set $t := t^1 \circ t^3$. The fact that $p \circ t$ belongs to \mathbf{W} follows from (BF2) together with conditions (2) and (4) in Lemma 3.1. \blacksquare

3.4. LEMMA. Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF), any pair of objects A, B , any pair of morphism $\underline{f}^m := (A^m, w^m, f^m) : A \rightarrow B$ for $m = 1, 2$ and any pair of 2-morphisms $\Gamma, \Gamma' : \underline{f}^1 \Rightarrow \underline{f}^2$ in $\mathcal{C}[\mathbf{W}^{-1}]$. Let us suppose that there are an object A^3 , a pair of morphisms \underline{v}^1 and \underline{v}^2 (such that $w^1 \circ v^1$ belongs to \mathbf{W}) and 2-morphisms α, γ and γ' in \mathcal{C} (with α invertible) as below, such that the following diagrams represent Γ , respectively Γ' :

Then the following facts are equivalent:

- (i) $\Gamma = \Gamma'$;
- (ii) there are an object A^4 and a morphism $z : A^4 \rightarrow A^3$ in \mathbf{W} , such that $\gamma \circ z = \gamma' \circ z$;
- (iii) there are an object A^4 and a morphism $z : A^4 \rightarrow A^3$, such that $v^1 \circ z$ belongs to \mathbf{W} and such that $\gamma \circ z = \gamma' \circ z$.

PROOF. Let us suppose that (i) holds and let us prove (iii). Using the description of 2-cells of $\mathcal{C}[\mathbf{W}^{-1}]$ that we recalled in the Introduction, there is a set of data $(E^1, r^1, r^2, \sigma, \rho)$ in \mathcal{C} as in the internal part of the following diagram

such that:

- $w^1 \circ v^1 \circ r^1$ belongs to \mathbf{W} ;
- σ and ρ are both invertible in \mathcal{C} ;
- $\alpha \circ r^2$ is equal to the following composition:

- $\gamma' \circ r^2$ is equal to the following composition:

Since Γ is a 2-morphism in $\mathcal{C}[\mathbf{W}^{-1}]$, w^1 and $w^1 \circ v^1$ both belong to \mathbf{W} ; so by Lemma 2.3 applied to σ there are an object E^2 , a morphism $r^3 : E^2 \rightarrow E^1$ in \mathbf{W} and an invertible 2-morphism $\tilde{\sigma} : r^2 \circ r^3 \Rightarrow r^1 \circ r^3$, such that $v^1 \circ \tilde{\sigma} = \sigma \circ r^3$.

Since $w^1 \circ v^1$ belongs to \mathbf{W} , by (BF5) applied α^{-1} we get that also $w^2 \circ v^2$ belongs to \mathbf{W} ; since also w^2 belongs to \mathbf{W} , by Lemma 2.3 applied to $\rho \circ r^3$ there are an object E^3 ,

a morphism $r^4 : E^3 \rightarrow E^2$ in \mathbf{W} and an invertible 2-morphism $\tilde{\rho} : r^1 \circ r^3 \circ r^4 \Rightarrow r^2 \circ r^3 \circ r^4$, such that $v^2 \circ \tilde{\rho} = \rho \circ r^3 \circ r^4$. Using (20), this implies that $\alpha \circ r^2 \circ r^3 \circ r^4$ is equal to the following composition:

$$\begin{array}{ccccccc}
 & & & E^1 & & A^1 & \\
 & & r^3 \nearrow & \Downarrow \tilde{\sigma} & \searrow r^2 & v^1 \nearrow & \\
 & & E^2 & \xrightarrow{r^3} & E^1 & \xrightarrow{r^1} & A^3 & \searrow w^1 & \\
 & r^4 \nearrow & & & & & & \Downarrow \alpha & \\
 & & E^2 & \xrightarrow{r^3} & E^1 & \xrightarrow{r^2} & A^2 & \nearrow w^2 & A. \\
 E^3 & \xrightarrow{r^4} & E^2 & \xrightarrow{r^3} & E^1 & & & & \\
 & & & & & & & &
 \end{array}$$

Since α is invertible by hypothesis, the previous identity implies that $w^1 \circ v^1 \circ \tilde{\sigma} \circ r^4 = w^1 \circ v^1 \circ \tilde{\rho}^{-1}$. Since $w^1 \circ v^1$ belongs to \mathbf{W} , by Lemma 2.1 there are an object E^4 and a morphism $r^5 : E^4 \rightarrow E^3$ in \mathbf{W} , such that

$$\tilde{\sigma} \circ r^4 \circ r^5 = \tilde{\rho}^{-1} \circ r^5. \tag{22}$$

From (21) we get that $\gamma' \circ r^2 \circ r^3 \circ r^4 \circ r^5$ is equal to the following composition:

$$\begin{array}{ccccccc}
 & & & E^1 & & A^1 & \\
 & & r^3 \nearrow & \Downarrow \tilde{\sigma} & \searrow r^2 & v^1 \nearrow & \\
 & & E^2 & \xrightarrow{r^3} & E^1 & \xrightarrow{r^1} & A^3 & \searrow f^1 & \\
 & r^4 \nearrow & & & & & & \Downarrow \gamma & \\
 & & E^2 & \xrightarrow{r^3} & E^1 & \xrightarrow{r^2} & A^2 & \nearrow f^2 & B. \\
 E^4 & \xrightarrow{r^5} & E^3 & \xrightarrow{r^4} & E^2 & \xrightarrow{r^3} & E^1 & & \\
 & & & & & & & &
 \end{array} \tag{23}$$

From (22) and (23) we conclude that

$$\gamma' \circ r^2 \circ r^3 \circ r^4 \circ r^5 = \gamma \circ r^2 \circ r^3 \circ r^4 \circ r^5. \tag{24}$$

By construction we have that $w^1 \circ v^1 \circ r^1$ belongs to \mathbf{W} , so also $w^1 \circ v^1 \circ r^2$ belongs to \mathbf{W} (using (BF5) on $w^1 \circ \sigma$). By construction r^3, r^4 and r^5 also belong to \mathbf{W} . Using (BF2), we conclude that also the morphism $w^1 \circ (v^1 \circ r^2 \circ r^3 \circ r^4 \circ r^5)$ belongs to \mathbf{W} .

By hypothesis w^1 also belongs to \mathbf{W} . So by Lemma 2.4 there are an object A^4 and a morphism $r^6 : A^4 \rightarrow E^4$, such that the morphism $v^1 \circ r^2 \circ r^3 \circ r^4 \circ r^5 \circ r^6$ also belongs to \mathbf{W} . We set $z := r^2 \circ r^3 \circ r^4 \circ r^5 \circ r^6 : A^4 \rightarrow A^3$ (so that $v^1 \circ z$ belongs to \mathbf{W}). Then (24) implies that $\gamma' \circ z = \gamma \circ z$, so (iii) holds.

Now let us assume (iii) and let us prove (ii). By hypothesis $v^1 \circ z$ belongs to \mathbf{W} ; moreover w^1 belongs to \mathbf{W} because f^1 is a morphism in $\mathcal{C}[\mathbf{W}^{-1}]$. Then by axiom (BF2) also $w^1 \circ v^1 \circ z$ belongs to \mathbf{W} . Again by hypothesis $w^1 \circ v^1$ belongs to \mathbf{W} . So by Lemma 2.4 there are an object A'^4 and a morphism $z' : A'^4 \rightarrow A^4$, such that $z \circ z'$ belongs to \mathbf{W} . By

(iii) we have $\gamma \circ z = \gamma' \circ z$, hence $\gamma \circ (z \circ z') = \gamma' \circ (z \circ z')$, so (ii) holds.

Lastly, if (ii) holds, then (i) is obviously satisfied using the definition of 2-morphism in $\mathcal{C}[\mathbf{W}^{-1}]$ and axiom (BF2). ■

3.5. REMARK. Let us fix any pair of objects A, B , any pair of morphisms $f^1, f^2 : A \rightarrow B$ and any 2-morphism $\rho : f^1 \Rightarrow f^2$ in \mathcal{C} . As explained in [P1996, § 2.4], the universal pseudofunctor $\mathcal{U}_{\mathbf{W}} : \mathcal{C} \rightarrow \mathcal{C}[\mathbf{W}^{-1}]$ is such that $\mathcal{U}_{\mathbf{W}}(f^m)$ is the triple $(A, \text{id}_A, f^m) : A \rightarrow B$ for each $m = 1, 2$, and $\mathcal{U}_{\mathbf{W}}(\rho)$ is the 2-morphism represented by the following diagram:

$$\begin{array}{ccccc}
 & & A & & \\
 & \swarrow \text{id}_A & \uparrow \text{id}_A & \searrow f^1 & \\
 A & & A & & B \\
 & \swarrow \text{id}_A & \downarrow \rho & \searrow f^2 & \\
 & & A & & \\
 & \swarrow \text{id}_A & \downarrow \text{id}_A & \searrow f^2 & \\
 & & A & &
 \end{array}
 \tag{25}$$

Now let us fix any 2-morphism $\Phi : \mathcal{U}_{\mathbf{W}}(f^1) \Rightarrow \mathcal{U}_{\mathbf{W}}(f^2)$. Using Corollary 3.3 with $(A^1, A^2, E, w^1, w^2, p, q, \varsigma) := (A, A, A, \text{id}_A, \text{id}_A, \text{id}_A, \text{id}_A, i_{\text{id}_A})$, there are an object A' , a morphism $t : A' \rightarrow A$ in \mathbf{W} and a 2-morphism $\varphi : f^1 \circ t \Rightarrow f^2 \circ t$, such that Φ is represented by the following diagram:

$$\begin{array}{ccccc}
 & & A & & \\
 & \swarrow \text{id}_A & \uparrow t & \searrow f^1 & \\
 A & & A' & & B \\
 & \swarrow \text{id}_A & \downarrow \varphi & \searrow f^2 & \\
 & & A & &
 \end{array}
 \tag{26}$$

Therefore the following facts are equivalent:

- (a) Φ is in the image of $\mathcal{U}_{\mathbf{W}}$;
- (b) there is a 2-morphism $\rho : f^1 \Rightarrow f^2$ in \mathcal{C} , such that (26) is equivalent to (25).

Since the class of (25) is equal to $[A', t, t, i_t, \rho \circ t]$, by Lemma 3.4 we get that (b) is equivalent to:

- (c) there are a 2-morphism $\rho : f^1 \Rightarrow f^2$ in \mathcal{C} , an object A'' and a morphism $z : A'' \rightarrow A'$ in \mathbf{W} , such that $\varphi \circ z = \rho \circ t \circ z$.

Therefore in general *the universal pseudofunctor $\mathcal{U}_{\mathbf{W}}$ is not 2-full*, but only “2-full modulo morphisms of \mathbf{W} ”. It is 2-full if and only if the pair $(\mathcal{C}, \mathbf{W})$ satisfies the following condition (in addition to the usual set of axioms (BF1) – (BF5)):

(BF6): for every pair of morphisms $f^1, f^2 : A \rightarrow B$, for every morphism $t : A' \rightarrow A$ in \mathbf{W} and for every 2-morphism $\varphi : f^1 \circ t \Rightarrow f^2 \circ t$, there are an object A'' , a morphism $z : A'' \rightarrow A'$ in \mathbf{W} and a 2-morphism $\rho : f^1 \Rightarrow f^2$, such that $\varphi \circ z = \rho \circ t \circ z$.

Now let us fix another 2-morphism $\rho' : f^1 \Rightarrow f^2$. Using (25) and Lemma 3.4, the following facts are equivalent:

- $\mathcal{U}_{\mathbf{W}}(\rho) = \mathcal{U}_{\mathbf{W}}(\rho')$;
- there are an object \tilde{A} and a morphism $u : \tilde{A} \rightarrow A$ in \mathbf{W} , such that $\rho \circ u = \rho' \circ u$.

This shows that in general *the universal pseudofunctor $\mathcal{U}_{\mathbf{W}}$ is not 2-faithful*, but only “2-faithful modulo morphisms of \mathbf{W} ”.

Now we are able to give the following proof:

PROOF OF PROPOSITION 1.1. Let us fix any representatives (15) for Γ and Γ' as in Lemma 3.2, any set of data (1) – (5) as in Lemma 3.1. Using Lemma 3.2, there are representatives for Γ and Γ' as in the first part of Proposition 1.1: it suffices to set $\alpha := \varsigma \circ t^1 \circ t^3$, $\gamma := \psi \circ t^1 \circ t^3$, $\gamma' := \varphi$, $v^1 := p \circ t^1 \circ t^3$ and $v^2 := q \circ t^1 \circ t^3$ in diagram (16).

Using the data (2) and (4), we get that v^1 belongs to \mathbf{W} . Moreover, w^1 belongs to \mathbf{W} because \underline{f}^1 is a morphism of $\mathcal{C}[\mathbf{W}^{-1}]$. Hence $w^1 \circ v^1$ also belongs to \mathbf{W} , so we can apply Lemma 3.4 in order to get the second part of Proposition 1.1. ■

3.6. REMARK. By induction and using the same ideas mentioned in this section, one can also prove that given finitely many 2-morphisms $\Gamma^1, \dots, \Gamma^n$ in $\mathcal{C}[\mathbf{W}^{-1}]$, all defined between the same pair of morphisms, there are data $A^3, v^1, v^2, \alpha, \gamma^1, \dots, \gamma^n$, such that v^1 belongs to \mathbf{W} , α is invertible and $\Gamma^m = [A^3, v^1, v^2, \alpha, \gamma^m]$ for each $m = 1, \dots, n$. In other words, given finitely many 2-morphisms with the same source and target, each of them admits a representative that differs from the other ones only in the last variable at most. However, in general the common data (A^3, v^1, v^2, α) depend on the 2-morphisms chosen: if we add another 2-morphism Γ^{n+1} to the collection above, then the new common data for $\Gamma^1, \dots, \Gamma^{n+1}$ in general is of the form $(A^4, v^1 \circ z, v^2 \circ z, \alpha \circ z)$ for some object A^4 and some morphism $z : A^4 \rightarrow A^3$ in \mathbf{W} .

4. The associators of a bicategory of fractions

As we mentioned in the Introduction, in order to prove Theorem 1.2 we need to show that the constructions of associators and vertical/horizontal compositions do not depend on the set of fixed choices $\mathbf{D}(\mathbf{W})$, but only on the choices $\mathbf{C}(\mathbf{W})$ (at most). We start with the description of associators in any bicategory of fractions:

4.1. PROPOSITION. (**associators of $\mathcal{C}[\mathbf{W}^{-1}]$**) Let us fix any triple of 1-morphisms in $\mathcal{C}[\mathbf{W}^{-1}]$ as follows:

$$\begin{aligned}\underline{f} &:= \left(A \xleftarrow{u} A' \xrightarrow{f} B \right), \\ \underline{g} &:= \left(B \xleftarrow{v} B' \xrightarrow{g} C \right), \\ \underline{h} &:= \left(C \xleftarrow{w} C' \xrightarrow{h} D \right).\end{aligned}\tag{27}$$

Let us suppose that the set of fixed choices $\mathbf{C}(\mathbf{W})$ gives data as in the upper part of the following diagrams (starting from the ones on the left), with u^1, u^2, v^1 and u^3 in \mathbf{W} and δ, σ, ξ and η invertible:

$$\begin{array}{ccc} \begin{array}{ccc} & A^1 & \\ u^1 \swarrow & \delta \Rightarrow & \searrow f^1 \\ A' & \xrightarrow{f} B \xleftarrow{v} B' & \end{array} & \begin{array}{ccc} & A^2 & \\ u^2 \swarrow & \sigma \Rightarrow & \searrow l \\ A^1 & \xrightarrow{g \circ f^1} C \xleftarrow{w} C' & \end{array} & \\ \\ \begin{array}{ccc} & B^2 & \\ v^1 \swarrow & \xi \Rightarrow & \searrow g^1 \\ B' & \xrightarrow{g} C \xleftarrow{w} C' & \end{array} & \begin{array}{ccc} & A^3 & \\ u^3 \swarrow & \eta \Rightarrow & \searrow f^2 \\ A' & \xrightarrow{f} B \xleftarrow{v \circ v^1} B^2 & \end{array} & \end{array}\tag{28}$$

so that by [P1996, § 2.2] one has

$$\underline{h} \circ (\underline{g} \circ \underline{f}) = \left(A \xleftarrow{u \circ u^1 \circ u^2} A^2 \xrightarrow{hol} D \right),\tag{29}$$

$$(\underline{h} \circ \underline{g}) \circ \underline{f} = \left(A \xleftarrow{u \circ u^3} A^3 \xrightarrow{hog^1 \circ f^2} D \right).\tag{30}$$

Then let us fix any set of data in \mathcal{C} as follows:

(F1): an object A^4 , a morphism $u^4 : A^4 \rightarrow A^2$ such that $u \circ u^1 \circ u^2 \circ u^4$ belongs to \mathbf{W} (for example, using (BF2) this is the case if u^4 belongs to \mathbf{W}), a morphism $u^5 : A^4 \rightarrow A^3$ and an invertible 2-morphism $\gamma : u^1 \circ u^2 \circ u^4 \Rightarrow u^3 \circ u^5$;

(F2): an invertible 2-morphism $\omega : f^1 \circ u^2 \circ u^4 \Rightarrow v^1 \circ f^2 \circ u^5$, such that $v \circ \omega$ is equal to

following composition:

$$\begin{array}{ccccc}
 & & A^2 & \xrightarrow{l} & C' \\
 & \nearrow \tilde{u}^4 & \searrow u^2 & & \downarrow \sigma^{-1} \\
 \tilde{A}^4 & & A^1 & \xrightarrow{f^1} & B' \\
 \downarrow \tilde{w} & & \downarrow v^1 & & \downarrow \xi \\
 & \searrow \tilde{u}^5 & A^3 & \xrightarrow{f^2} & B^2 \\
 & & \downarrow f^2 & & \downarrow g^1 \\
 & & B^2 & \xrightarrow{g^1} & C' \\
 & & & & \downarrow w \\
 & & & & C.
 \end{array}
 \tag{35}$$

Then proving the claim is equivalent to proving that (33) is equivalent to:

$$\begin{array}{ccccc}
 & & A^2 & \xrightarrow{h \circ l} & D \\
 & \nearrow u \circ u^1 \circ u^2 & \downarrow u \circ \tilde{\gamma} & \tilde{A}^4 & \downarrow h \circ \tilde{\rho} \\
 A & & & & \\
 & \searrow u \circ u^3 & A^3 & \xrightarrow{h \circ g^1 \circ f^2} & D \\
 & & \uparrow \tilde{u}^4 & & \\
 & & \tilde{A}^4 & & \\
 & & \downarrow \tilde{u}^5 & &
 \end{array}
 \tag{36}$$

Step 2. We want to construct a pair of diagrams that are equivalent to (33), respectively to (36), and that share a common “left hand side”. For this, we follow the procedure explained in Lemmas 3.1 and 3.2. Using Lemma 3.1, there are a pair of objects F^1 and F^2 , a triple of morphisms t^1 , t^2 and t^3 , such that both $u^4 \circ t^1$ and t^3 belong to \mathbf{W} , and a pair of invertible 2-morphisms ε and κ in \mathcal{C} as follows

$$\begin{array}{ccc}
 & F^1 & \\
 t^1 \swarrow & & \searrow t^2 \\
 A^4 & \xrightarrow{u^4} & A^2 \xleftarrow{\tilde{u}^4} \tilde{A}^4 \\
 & \varepsilon \Rightarrow &
 \end{array}
 \qquad
 \begin{array}{ccc}
 & F^2 & \\
 t^3 \swarrow & & \searrow t^3 \\
 F^1 & \xrightarrow{\tilde{u}^5 \circ t^2} & A^3 \xleftarrow{u^5 \circ t^1} F^1 \\
 & \kappa \Rightarrow &
 \end{array}$$

such that $u \circ \gamma \circ t^1 \circ t^3$ is equal to the following composition:

$$\begin{array}{ccccccc}
 & & & t^1 & \rightarrow & A^4 & \xrightarrow{u^4} & A^1 \\
 & & & \downarrow \varepsilon & & \downarrow \tilde{\gamma} & & \\
 & & & F^1 & \rightarrow & A^2 & \rightarrow & A' \xrightarrow{u} A \\
 & & & \downarrow \kappa & & \downarrow \tilde{u}^4 & & \\
 & & & \tilde{A}^4 & \rightarrow & A^3 & \xrightarrow{u^3} & \\
 F^2 & \xrightarrow{t^3} & F^1 & \xrightarrow{t^1} & A^4 & \xrightarrow{u^5} & A^3 & \\
 & & & & & & &
 \end{array}
 \tag{37}$$

$$\begin{array}{ccccccc}
 & & & & A^4 & \xrightarrow{u^4} & A^2 & \xrightarrow{l} & C' & & \\
 & & & & \downarrow \varepsilon & & \downarrow \tilde{\omega} & & \downarrow \sigma^{-1} & & \\
 & & & & A^4 & \xrightarrow{\tilde{u}^4} & A^1 & & B' & \xrightarrow{g} & C. \\
 & & & & \downarrow \kappa & & \downarrow \xi & & \downarrow \xi & & \\
 & & & & A^4 & \xrightarrow{u^5} & A^3 & \xrightarrow{f^2} & B^2 & \xrightarrow{g^1} & C' & \xrightarrow{w} & C. \\
 & & & & \downarrow \kappa & & \downarrow \xi & & \downarrow \xi & & \\
 F^4 & \xrightarrow{t^5} & F^3 & \xrightarrow{t^4} & F^2 & \xrightarrow{t^3} & F^1 & \xrightarrow{t^1} & A^4 & \xrightarrow{u^4} & A^2 & \xrightarrow{l} & C' & \xrightarrow{w} & C. \\
 & & & & \downarrow \kappa & & \downarrow \xi & & \downarrow \xi & & \\
 & & & & A^4 & \xrightarrow{u^5} & A^3 & \xrightarrow{f^2} & B^2 & \xrightarrow{g^1} & C' & \xrightarrow{w} & C.
 \end{array}$$

Using (43) we conclude that $w \circ \zeta \circ t^4 \circ t^5$ coincides also with the composition

$$\begin{array}{ccccccc}
 & & & & A^4 & \xrightarrow{u^4} & A^2 & \xrightarrow{l} & C' & & \\
 & & & & \downarrow \omega & & \downarrow \sigma^{-1} & & \downarrow \sigma^{-1} & & \\
 & & & & A^4 & \xrightarrow{u^5} & A^3 & \xrightarrow{f^2} & B^2 & \xrightarrow{g^1} & C' & \xrightarrow{w} & C. \\
 & & & & \downarrow \omega & & \downarrow \xi & & \downarrow \xi & & \\
 F^4 & \xrightarrow{t^5} & F^3 & \xrightarrow{t^4} & F^2 & \xrightarrow{t^3} & F^1 & \xrightarrow{t^1} & A^4 & \xrightarrow{u^4} & A^2 & \xrightarrow{l} & C' & \xrightarrow{w} & C. \\
 & & & & \downarrow \omega & & \downarrow \xi & & \downarrow \xi & & \\
 & & & & A^4 & \xrightarrow{u^5} & A^3 & \xrightarrow{f^2} & B^2 & \xrightarrow{g^1} & C' & \xrightarrow{w} & C.
 \end{array}$$

Using the previous identity and (32), we conclude that $w \circ \rho \circ t^1 \circ t^3 \circ t^4 \circ t^5 = w \circ \zeta \circ t^4 \circ t^5$. Using Lemma 2.1, this implies that there are an object F^5 and a morphism $t^6 : F^5 \rightarrow F^4$ in \mathbf{W} , such that $\rho \circ t^1 \circ t^3 \circ t^4 \circ t^5 \circ t^6 = \zeta \circ t^4 \circ t^5 \circ t^6$. This implies that:

$$(h \circ \rho \circ t^1 \circ t^3) \circ (t^4 \circ t^5 \circ t^6) = (h \circ \zeta) \circ (t^4 \circ t^5 \circ t^6). \quad (44)$$

Step 6. By construction the morphisms t^4 , t^5 and t^6 all belong to \mathbf{W} , so their composition also belongs to \mathbf{W} by (BF2). So (44) and Lemma 3.4(ii) imply that (38) and (39) are equivalent, so we conclude by Step 3. \blacksquare

4.3. REMARK. In order to find a set of data $(A^4, u^4, u^5, \gamma, \omega, \rho)$ as in (F1) – (F3) you can follow the construction in [P1996, Appendix A.2]. However, such a procedure is long: a shorter construction is the following one. First of all, we use axiom (BF3) in order to get data as in the upper part of the following diagram, with \bar{u}^4 in \mathbf{W} and $\bar{\gamma}$ invertible:

$$\begin{array}{ccccc}
 & & E & & \\
 & \swarrow \bar{u}^4 & & \searrow \bar{u}^5 & \\
 A^2 & \xrightarrow{u^1 \circ u^2} & A' & \xleftarrow{u^3} & A^3. \\
 & & \bar{\gamma} & & \\
 & & \Rightarrow & &
 \end{array}$$

Then we use (BF4a) and (BF4b) in order to get an object F , a morphism $z : F \rightarrow E$ in \mathbf{W} and an invertible 2-morphism $\bar{\omega} : f^1 \circ u^2 \circ \bar{u}^4 \circ z \Rightarrow v^1 \circ f^2 \circ \bar{u}^5 \circ z$, such that $v \circ \bar{\omega}$ is equal to the following composition:

Then we use again (BF4a) and (BF4b) in order to get an object A^4 , a morphism $r : A^4 \rightarrow F$ in \mathbf{W} and an invertible 2-morphism $\rho : l \circ \bar{u}^4 \circ z \circ r \Rightarrow g^1 \circ f^2 \circ \bar{u}^5 \circ z \circ r$, such that $w \circ \rho$ is equal to the following composition:

Then it suffices to define $u^4 := \bar{u}^4 \circ z \circ r$, $u^5 := \bar{u}^5 \circ z \circ r$, $\gamma := \bar{\gamma} \circ z \circ r$ and $\omega := \bar{\omega} \circ r$. Note that u^4 belongs to \mathbf{W} by construction and (BF2). Since u , u^1 and u^2 belong to \mathbf{W} by hypothesis or construction, (F1) holds by (BF2). Also (F2) and (F3) are easily verified. Above we used axioms (BF3) and (BF4), hence the data that we found are in general non-unique.

In the following Corollary, differently from the previous statements, we need to explicitly use the associators and the right and left unitors for \mathcal{C} . We denote these 2-morphisms by $\theta_{a,b,c} : a \circ (b \circ c) \Rightarrow (a \circ b) \circ c$ (for any triple of composable morphisms a, b, c), respectively by $\pi_a : a \circ \text{id}_A \Rightarrow a$, respectively by $\nu_a : \text{id}_B \circ a \Rightarrow a$ (for any morphism $a : A \rightarrow B$).

4.4. COROLLARY. *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF), any triple of morphisms $\underline{f}, \underline{g}, \underline{h}$ as in (27) and let us suppose that $B = B', C = C', \nu = \text{id}_B$ and $w = \text{id}_C$. Moreover, let us suppose that the set of fixed choices $\mathbf{C}(\mathbf{W})$ gives data as in the upper part of the following diagram, with u^3 in \mathbf{W} and η invertible:*

$$\begin{array}{ccccc}
 & & A^3 & & \\
 & u^3 \swarrow & & \searrow f^2 & \\
 A' & & & & B \\
 & \xrightarrow{f} & & \xleftarrow{\text{id}_B \circ \text{id}_B} & \\
 & & B & &
 \end{array}
 \quad \begin{array}{c} \eta \\ \Rightarrow \end{array}
 \quad (45)$$

Then

$$\underline{h} \circ (\underline{g} \circ \underline{f}) = \left(A \xleftarrow{(u \circ \text{id}_{A'}) \circ \text{id}_{A'}} A' \xrightarrow{h \circ (g \circ f)} D \right), \tag{46}$$

$$(\underline{h} \circ \underline{g}) \circ \underline{f} = \left(A \xleftarrow{u \circ u^3} A^3 \xrightarrow{(h \circ g) \circ f^2} D \right) \tag{47}$$

and the associator $\Theta_{\underline{h}, \underline{g}, \underline{f}}^{\mathcal{C}, \mathbf{W}}$ from (46) to (47) is represented by the following diagram:

$$\begin{array}{ccccc}
 & & A' & & \\
 & \swarrow^{(u \circ \text{id}_{A'}) \circ \text{id}_{A'}} & \uparrow^{u^3} & \searrow^{h \circ (g \circ f)} & \\
 A & & A^3 & & D, \\
 & \searrow_{u \circ u^3} & \downarrow^{\text{id}_{A^3}} & \swarrow_{(h \circ g) \circ f^2} & \\
 & & A^3 & &
 \end{array}
 \tag{48}$$

where α is the following composition

$$\begin{array}{ccccc}
 & & A' & & \\
 & \swarrow^{\text{id}_{A'}} & \downarrow^{\pi_u} & \searrow^{u \circ \text{id}_{A'}} & \\
 & & A' & & A \\
 & \swarrow^{u^3} & \downarrow^{\pi_u} & \searrow^u & \\
 A^3 & & A^3 & & A \\
 & \searrow_{\text{id}_{A^3}} & \downarrow^{\pi_{u \circ u^3}^{-1}} & \swarrow_{u \circ u^3} & \\
 & & A^3 & &
 \end{array}$$

and β is the following one:

$$\begin{array}{ccccc}
 & & A' & \xrightarrow{g \circ f} & C \\
 & \swarrow^{u^3} & \downarrow^{\pi_u} & \searrow^f & \downarrow^h \\
 & & A' & \xrightarrow{f} & B \\
 & \swarrow^{f \circ u^3} & \downarrow^{\pi_{u \circ u^3}^{-1}} & \searrow^{h \circ g} & \downarrow^{\theta_{h,g,f}} \\
 A^3 & \xrightarrow{f^2} & B & \xrightarrow{h \circ g} & D \\
 & \downarrow^{\eta} & \downarrow^{v_{\text{id}_B}} & \downarrow^{\pi_{(h \circ g) \circ f^2}^{-1}} & \\
 & \downarrow^{v_{f^2}} & \downarrow^{\text{id}_B} & \downarrow^{\pi_{(h \circ g) \circ f^2}^{-1}} & \\
 & \swarrow_{f^2} & \downarrow^{\text{id}_B} & \swarrow_{(h \circ g) \circ f^2} & \\
 & & A^3 & \xrightarrow{(h \circ g) \circ f^2} &
 \end{array}$$

4.5. REMARK. If \mathcal{C} is a 2-category, then the associators θ_\bullet and the unitors π_\bullet and v_\bullet are all trivial; moreover, $\text{id}_B \circ \text{id}_B = \text{id}_B$. We recall that the fixed choices $\mathbf{C}(\mathbf{W})$ imposed by Pronk on any pair (f, v) assume a very simple form in the case when either f or v are an identity (see [P1996, p. 256]), so the quadruple (A^3, u^3, f^2, η) of (45) coincides with $(A', \text{id}_{A'}, f, i_f)$. So if \mathcal{C} is a 2-category, then the morphisms (46) and (47) coincide, and the associator (48) is the 2-identity of this morphism.

PROOF OF COROLLARY 4.4. This is the first proof where we explicitly need to use associators and unitors of \mathcal{C} because we cannot prove the statement only in the special case of a 2-category and then appeal to coherence results for the general case. First, anyway, we prove this special case.

By the already mentioned [P1996, p. 256], since both v and w are identities, one gets that the 4 diagrams of (28) (chosen from left to right) assume this simple form:

$$\begin{array}{ccc}
 \begin{array}{c}
 A^1 := A' \\
 \begin{array}{ccc}
 u^1 := \text{id}_{A'} & & f^1 := f \\
 \swarrow & \delta := i_f & \searrow \\
 A' & \xrightarrow{f} B & \xleftarrow{v = \text{id}_B} B' = B, \\
 \end{array}
 \end{array} & &
 \begin{array}{c}
 A^2 := A' \\
 \begin{array}{ccc}
 u^2 := \text{id}_{A'} & & l := g \circ f \\
 \swarrow & \sigma := i_{g \circ f} & \searrow \\
 A^1 = A' & \xrightarrow{g \circ f^1 = g \circ f} C & \xleftarrow{w = \text{id}_C} C' = C, \\
 \end{array}
 \end{array} \\
 \\
 \begin{array}{c}
 B^2 := B \\
 \begin{array}{ccc}
 v^1 := \text{id}_B & & g^1 := g \\
 \swarrow & \xi := i_g & \searrow \\
 B' = B & \xrightarrow{g} C & \xleftarrow{w = \text{id}_C} C' = C, \\
 \end{array}
 \end{array} & &
 \begin{array}{c}
 A^3 := A' \\
 \begin{array}{ccc}
 u^3 := \text{id}_{A'} & & f^2 := f \\
 \swarrow & \eta := i_f & \searrow \\
 A' & \xrightarrow{f} B & \xleftarrow{v \circ v^1 = \text{id}_B} B^2 = B. \\
 \end{array}
 \end{array}
 \end{array} \tag{49}$$

Then identities (46) and (47) follow at once from (29) and (30). In order to compute the associator, according to Proposition 4.1 we have to fix any set of data as in (F1) – (F3). For that, we choose:

- $A^4 := A'$, $u^4 := \text{id}_{A'}$, $u^5 := \text{id}_{A'}$ and $\gamma := i_{\text{id}_{A'}}$;
- $\omega := i_f$;
- $\rho := i_{g \circ f}$.

Then the claim follows from Proposition 4.1. In the general case when \mathcal{C} is a bicategory, by [P1996, p. 256] the first diagram in (49) is given by

$$\begin{array}{c}
 A^1 := A' \\
 \begin{array}{ccc}
 u^1 := \text{id}_{A'} & & f^1 := f \\
 \swarrow & \delta := v_f^{-1} \circ \pi_f & \searrow \\
 A' & \xrightarrow{f} B & \xleftarrow{v = \text{id}_B} B' = B, \\
 \end{array}
 \end{array}$$

and analogously for the second diagram and for the third one in (49); the fourth diagram must be replaced by (45). Indeed, if \mathcal{C} is simply a bicategory, in general we cannot write $v \circ v^1 = \text{id}_B \circ \text{id}_B$ in a simpler form, hence we cannot say anything more precise about the data in diagram (45) (it is completely determined as one of the fixed choices in the set $C(\mathbf{W})$, so we have no control over it). The data of (F1) – (F3) above have to be changed according to these choices; then the statement follows again from Proposition 4.1. ■

5. Vertical composition

Following the plan explained in the Introduction, in this section we will prove that the vertical composition in $\mathcal{C}[\mathbf{W}^{-1}]$ does not depend on the set of choices $\mathbf{D}(\mathbf{W})$ (actually, it does not depend on $\mathbf{C}(\mathbf{W})$ either). In doing that, we will also provide a simple way of computing a representative for the vertical composition of any pair of 2-morphisms Γ^1, Γ^2 in any bicategory of fractions, having fixed representatives for Γ^1 and Γ^2 .

5.1. PROPOSITION. (**vertical composition**) *Let us fix any pair of objects A, B , any triple of morphisms $\underline{f}^m := (A^m, w^m, f^m) : A \rightarrow B$ for $m = 1, 2, 3$ and any pair of 2-morphisms $\Gamma^1 : \underline{f}^1 \Rightarrow \underline{f}^2$ and $\Gamma^2 : \underline{f}^2 \Rightarrow \underline{f}^3$ in $\mathcal{C}[\mathbf{W}^{-1}]$; let us fix any representative for Γ^1 , respectively for Γ^2 , as follows:*

$$\begin{array}{ccc}
 & A^1 & \\
 w^1 \swarrow & & \searrow f^1 \\
 A & & B \\
 w^2 \swarrow & & \searrow f^2 \\
 & A^2 & \\
 \Downarrow \alpha^1 & \uparrow u^1 & \Downarrow \beta^1 \\
 & A^4 & \\
 \Downarrow \alpha^2 & \uparrow u^3 & \Downarrow \beta^2 \\
 & A^5 & \\
 w^3 \swarrow & & \searrow f^3 \\
 & A^3 &
 \end{array}
 \tag{50}$$

Then let us fix any set of data in \mathcal{C} as follows:

(F4): *an object C , a morphism t^1 in \mathbf{W} , a morphism t^2 and an invertible 2-morphism ρ in \mathcal{C} as below:*

$$\begin{array}{ccc}
 & C & \\
 t^1 \swarrow & & \searrow t^2 \\
 A^4 & \xrightarrow{u^2} & A^2 \xleftarrow{u^3} A^5 \\
 & \xRightarrow{\rho} &
 \end{array}$$

Then the vertical composition $\Gamma^2 \circ \Gamma^1$ is represented by the following diagram

$$\begin{array}{ccc}
 & A^1 & \\
 w^1 \swarrow & & \searrow f^1 \\
 A & & B \\
 w^3 \swarrow & & \searrow f^3 \\
 & A^3 & \\
 \Downarrow \xi & \uparrow u^1 \circ t^1 & \Downarrow \gamma \\
 & C & \\
 \Downarrow \xi & \uparrow u^4 \circ t^2 & \Downarrow \gamma \\
 & A^3 &
 \end{array}
 \tag{51}$$

where ξ and γ are the following compositions:

$$\begin{array}{c}
 \xi : \\
 \begin{array}{ccccc}
 & & A^4 & \xrightarrow{u^1} & A^1 \\
 & \nearrow t^1 & \searrow & & \searrow w^1 \\
 C & & & & A \\
 & \searrow t^2 & \nearrow & & \nearrow w^2 \\
 & & A^5 & \xrightarrow{u^4} & A^3
 \end{array}
 \end{array}$$

$\Downarrow \rho$

$\Downarrow \alpha^1$

$\Downarrow \alpha^2$

(52)

$$\begin{array}{c}
 \gamma : \\
 \begin{array}{ccccc}
 & & A^4 & \xrightarrow{u^1} & A^1 \\
 & \nearrow t^1 & \searrow & & \searrow f^1 \\
 C & & & & B \\
 & \searrow t^2 & \nearrow & & \nearrow f^2 \\
 & & A^5 & \xrightarrow{u^4} & A^3
 \end{array}
 \end{array}$$

$\Downarrow \rho$

$\Downarrow \beta^1$

$\Downarrow \beta^2$

(53)

Given any other pair of representatives (50) for Γ^1 and Γ^2 , and any other set of data as in (F4), the diagram (51) induced by the new data represents the same 2-morphism as (51).

In particular, the vertical composition in $\mathcal{C}[\mathbf{W}^{-1}]$ does not depend on the set of choices $\mathbf{C}(\mathbf{W})$ nor on the set of choices $\mathbf{D}(\mathbf{W})$, hence it is the same in any bicategory of fractions constructed from the pair $(\mathcal{C}, \mathbf{W})$.

5.2. REMARK. Since Γ^2 is a 2-morphism in $\mathcal{C}[\mathbf{W}^{-1}]$, both w^2 and $w^2 \circ u^3$ belong to \mathbf{W} . Therefore by Lemma 2.2 a set of choices as in (F4) always exists, but in general it is not unique.

The proof of Proposition 5.1 mostly relies on the following:

5.3. LEMMA. Let us assume the same notations as Proposition 5.1. Moreover, let us choose:

(F4)': an object D , a morphism p^1 in \mathbf{W} , a morphism p^2 and an invertible 2-morphism μ as follows:

$$\begin{array}{ccccc}
 & & D & & \\
 & \swarrow p^1 & & \searrow p^2 & \\
 A^4 & \xrightarrow{u^2} & A^2 & \xleftarrow{u^3} & A^5
 \end{array}$$

$\mu \Rightarrow$

Let φ and δ be the following compositions:

$$\begin{array}{c}
 \varphi : \\
 \begin{array}{ccccc}
 & & A^4 & \xrightarrow{u^1} & A^1 \\
 & \nearrow p^1 & \searrow & & \searrow w^1 \\
 D & & & & A \\
 & \searrow p^2 & \nearrow & & \nearrow w^2 \\
 & & A^5 & \xrightarrow{u^4} & A^3 \\
 & & \nearrow u^2 & & \nearrow u^3 \\
 & & \searrow u^3 & & \searrow u^2 \\
 & & A^2 & \xrightarrow{w^2} & A
 \end{array}
 \end{array}
 \quad (54)$$

$$\begin{array}{c}
 \delta : \\
 \begin{array}{ccccc}
 & & A^4 & \xrightarrow{u^1} & A^1 \\
 & \nearrow p^1 & \searrow & & \searrow f^1 \\
 D & & & & B \\
 & \searrow p^2 & \nearrow & & \nearrow f^2 \\
 & & A^5 & \xrightarrow{u^4} & A^3 \\
 & & \nearrow u^2 & & \nearrow u^3 \\
 & & \searrow u^3 & & \searrow u^2 \\
 & & A^2 & \xrightarrow{f^2} & B
 \end{array}
 \end{array}
 \quad (55)$$

Then the following diagram

$$\begin{array}{ccccc}
 & & A^1 & & \\
 & \nearrow w^1 & \uparrow u^1 \circ p^1 & \searrow f^1 & \\
 A & & D & & B \\
 & \searrow w^3 & \downarrow u^4 \circ p^2 & \nearrow f^3 & \\
 & & A^3 & &
 \end{array}
 \quad (56)$$

represents the same 2-cell of $\mathcal{C}[\mathbf{W}^{-1}]$ as diagram (51).

PROOF. **Step 1.** Let us apply Lemma 3.1 on the following pair of diagrams:

$$\begin{array}{ccc}
 \begin{array}{ccc}
 & A^4 & \\
 & \nearrow u^2 & \\
 A^2 & & C \\
 & \searrow u^3 & \\
 & A^5 &
 \end{array}
 &
 &
 \begin{array}{ccc}
 & A^4 & \\
 & \nearrow u^2 & \\
 A^2 & & D \\
 & \searrow u^3 & \\
 & A^5 &
 \end{array}
 \end{array}$$

Then there are a pair of objects E^1 and E^2 , a triple of morphisms q^1, q^2 and q^3 , such that both $t^1 \circ q^1$ and q^3 belong to \mathbf{W} , and a pair of invertible 2-morphisms ε and κ in \mathcal{C} as follows:

$$\begin{array}{ccc}
 \begin{array}{ccc}
 & E^1 & \\
 & \nearrow q^1 & \\
 C & & D \\
 & \searrow q^2 & \\
 & A^4 &
 \end{array}
 \xrightarrow{\varepsilon}
 \begin{array}{ccc}
 & E^2 & \\
 & \nearrow q^3 & \\
 E^1 & & E^1 \\
 & \searrow q^3 & \\
 & A^5 &
 \end{array}
 \end{array}$$

such that $\rho \circ q^1 \circ q^3$ is equal to the composition of the following diagram:

$$\begin{array}{ccccccc}
 & & E^1 & \xrightarrow{q^1} & C & \xrightarrow{t^1} & A^4 \\
 & \nearrow q^3 & \downarrow \kappa & \searrow q^2 & \downarrow \varepsilon & \xrightarrow{p^1} & \downarrow \mu \\
 E^2 & \xrightarrow{q^3} & E^1 & \xrightarrow{q^1} & C & \xrightarrow{p^2} & A^4 \\
 & & & & & \searrow t^2 & \downarrow \mu \\
 & & & & & & A^5 \xrightarrow{u^2} A^2. \\
 & & & & & & \uparrow u^3
 \end{array} \tag{57}$$

Step 2. Using the definition of ξ in (52) together with (57), we get that $\xi \circ q^1 \circ q^3$ is equal to the following composition:

$$\begin{array}{ccccccccccc}
 & & & & C & \xrightarrow{t^1} & A^4 & \xrightarrow{u^1} & A^1 & \xrightarrow{w^1} & A \\
 & & \nearrow q^1 & \downarrow \varepsilon & \searrow p^1 & \downarrow \mu & \searrow u^2 & \downarrow \alpha^1 & \searrow w^2 & & \\
 E^2 & \xrightarrow{q^3} & E^1 & \xrightarrow{q^2} & D & \xrightarrow{p^2} & A^5 & \xrightarrow{u^3} & A^2 & \xrightarrow{w^2} & A \\
 & & \downarrow \kappa & \downarrow \kappa & \downarrow \kappa & \downarrow \kappa & \downarrow \kappa & \downarrow \alpha^2 & \downarrow \alpha^2 & \downarrow \alpha^2 & \\
 & & E^1 & \xrightarrow{q^1} & C & \xrightarrow{t^2} & A^5 & \xrightarrow{u^4} & A^3 & \xrightarrow{w^3} & A
 \end{array} \tag{58}$$

Using (58) and the definition of φ in (54), we conclude that $\xi \circ q^1 \circ q^3$ is also equal to the following composition:

$$\begin{array}{ccccccc}
 & & C & \xrightarrow{u^1 \circ t^1} & A^1 & \xrightarrow{w^1} & A \\
 & \nearrow q^1 & \downarrow \varepsilon & \searrow p^1 & \downarrow \varphi & \searrow w^2 & \\
 E^2 & \xrightarrow{q^3} & E^1 & \xrightarrow{q^2} & D & \xrightarrow{u^4 \circ p^2} & A^3 \\
 & & \downarrow \kappa & \downarrow \kappa & \downarrow \kappa & \downarrow \kappa & \\
 & & E^1 & \xrightarrow{q^1} & C & \xrightarrow{u^4 \circ t^2 \circ q^1} & A^3
 \end{array}$$

Step 3. Using the definition of γ in (53) together with (57), we get that $\gamma \circ q^1 \circ q^3$ is equal to the following composition:

$$\begin{array}{ccccccc}
 & & C & \xrightarrow{t^1} & A^4 & \xrightarrow{u^1} & A^1 \\
 & \nearrow q^1 & \downarrow \varepsilon & \searrow p^1 & \downarrow \mu & \searrow u^2 & \downarrow \beta^1 \\
 E^2 & \xrightarrow{q^3} & E^1 & \xrightarrow{q^2} & D & \xrightarrow{p^2} & A^2 \\
 & & \downarrow \kappa & \downarrow \kappa & \downarrow \kappa & \downarrow \kappa & \downarrow \beta^2 \\
 & & E^1 & \xrightarrow{q^1} & C & \xrightarrow{t^2} & A^5 \xrightarrow{u^4} A^3 \\
 & & & & & & \downarrow \beta^2 \\
 & & & & & & A^3 \xrightarrow{f^3} B
 \end{array} \tag{59}$$

Using (59) and the definition of δ in (55), we conclude that $\gamma \circ q^1 \circ q^3$ is also equal to the following composition:

$$\begin{array}{ccccc}
 & & C & \xrightarrow{u^1 \circ t^1} & A^1 \\
 & q^1 \nearrow & & \downarrow u^1 \circ \varepsilon & \nearrow u^1 \circ p^1 \\
 & E^1 & \xrightarrow{q^2} & D & \downarrow \delta \\
 q^3 \nearrow & & & \downarrow u^4 \circ \kappa & \nearrow u^4 \circ p^2 \\
 E^2 \xrightarrow{q^3} & E^1 & \xrightarrow{u^4 \circ t^2 \circ q^1} & A^3 & \nearrow f^3 \\
 & & & & \searrow f^1 \\
 & & & & B.
 \end{array}$$

Step 4. Using Steps 2 and 3 together with Lemma 3.2 on the (classes of the) diagrams (51) and (56), with the data (1) – (5) given by $(E^1, E^2, q^1, q^2, q^3, u^1 \circ \varepsilon, u^4 \circ \kappa)$, we conclude that the classes of the diagrams (51) and (56) have representatives that are equal. In other terms, (51) and (56) represent the same 2-cell of $\mathcal{C}[\mathbf{W}^{-1}]$, as we wanted to prove. ■

PROOF OF PROPOSITION 5.1. Following [P1996, p. 258], the vertical composition $\Gamma^2 \circ \Gamma^1$ can be computed by choosing any pair of representatives for Γ^1 and Γ^2 (as we did in (50)). Having fixed such representatives, the construction of the vertical composition in [P1996] is a special case of the construction of Proposition 5.1. In particular, the construction in [P1996] a priori holds only for a specific set of data as in (F4), induced by the fixed set of choices $\mathbf{C}(\mathbf{W})$ and $\mathbf{D}(\mathbf{W})$. Lemma 5.3 proves that any other set of data as in (F4) induces the same 2-cell of $\mathcal{C}[\mathbf{W}^{-1}]$. Since the construction in [P1996], does not depend on the representatives for Γ^1 and Γ^2 , the construction in Proposition 5.1 also does not depend on the chosen representatives for Γ^1 and Γ^2 , so we conclude. ■

6. Horizontal composition with 1-morphisms on the left

6.1. PROPOSITION. (**horizontal composition with 1-morphisms on the left**) *Let us fix any morphism $f := (A', w, f) : A \rightarrow B$, any pair of morphisms $g^m := (B^m, v^m, g^m) : B \rightarrow C$ for $m = 1, 2$, and any 2-morphism $\Delta : \underline{g}^1 \Rightarrow \underline{g}^2$ in $\mathcal{C}[\mathbf{W}^{-1}]$. Let us fix also any representative for Δ as below:*

$$\begin{array}{ccccc}
 & & B^1 & & \\
 & v^1 \swarrow & \uparrow u^1 & \searrow g^1 & \\
 B & & B^3 & & C. \\
 & \downarrow \alpha & \downarrow \beta & & \\
 & v^2 \swarrow & \downarrow u^2 & \searrow g^2 & \\
 & & B^2 & &
 \end{array}$$

(60)

Let us suppose that the fixed set of choices $\mathbf{C}(\mathbf{W})$ gives data as in the upper part of

the following diagrams, with w^1 and w^2 in \mathbf{W} , and ρ^1 and ρ^2 invertible:

$$\begin{array}{ccc}
 & D^1 & \\
 w^1 \swarrow & \rho^1 & \searrow f^1 \\
 A' \xrightarrow{f} B & \Rightarrow & B \xleftarrow{v^1} B^1,
 \end{array}
 \quad
 \begin{array}{ccc}
 & D^2 & \\
 w^2 \swarrow & \rho^2 & \searrow f^2 \\
 A' \xrightarrow{f} B & \Rightarrow & B \xleftarrow{v^2} B^2
 \end{array}
 \tag{61}$$

(so that by [P1996, § 2.2] we have $\underline{g}^m \circ \underline{f} = (D^m, w \circ w^m, g^m \circ f^m)$ for $m = 1, 2$). Then let us fix any set of data in \mathcal{C} as follows:

(F5): we choose data as in the upper part of the following diagrams, with t^1 and t^2 in \mathbf{W} , and σ^1 and σ^2 invertible:

$$\begin{array}{ccc}
 & D^3 & \\
 t^1 \swarrow & \sigma^1 & \searrow h^1 \\
 D^1 \xrightarrow{f^1} B^1 & \Rightarrow & B^1 \xleftarrow{u^1} B^3,
 \end{array}
 \quad
 \begin{array}{ccc}
 & D^4 & \\
 t^2 \swarrow & \sigma^2 & \searrow h^2 \\
 D^2 \xrightarrow{f^2} B^2 & \Rightarrow & B^2 \xleftarrow{u^2} B^3;
 \end{array}
 \tag{62}$$

(F6): we choose any set of data as in the upper part of the following diagram, with t^3 in \mathbf{W} and φ invertible:

$$\begin{array}{ccc}
 & D^5 & \\
 t^3 \swarrow & \varphi & \searrow t^4 \\
 D^3 \xrightarrow{w^1 \circ t^1} A' & \Rightarrow & A' \xleftarrow{w^2 \circ t^2} D^4;
 \end{array}$$

(F7): we choose any invertible 2-morphism $\delta : h^1 \circ t^3 \Rightarrow h^2 \circ t^4$, such that $v^1 \circ u^1 \circ \delta$ is equal to the following composition:

$$\begin{array}{ccccccc}
 & & & B^3 & & & \\
 & & & \nearrow h^1 & \searrow u^1 & & \\
 & & D^3 & \xrightarrow{t^1} & D^1 & \xrightarrow{f^1} & B^1 \\
 & & \downarrow \varphi & & \downarrow (\sigma^1)^{-1} & & \downarrow (\rho^1)^{-1} \\
 D^5 & \xrightarrow{t^3} & D^3 & \xrightarrow{t^1} & D^1 & \xrightarrow{f^1} & B^1 \\
 & & \downarrow \varphi & & \downarrow \sigma^2 & & \downarrow \rho^2 \\
 & & D^4 & \xrightarrow{t^2} & D^2 & \xrightarrow{f^2} & B^2 \\
 & & \downarrow h^2 & & \downarrow \sigma^2 & & \downarrow \alpha^{-1} \\
 & & D^4 & \xrightarrow{t^2} & D^2 & \xrightarrow{f^2} & B^2 \\
 & & & \searrow h^2 & \searrow u^2 & & \searrow v^2 \\
 & & & & B^3 & \xrightarrow{u^1} & B^1 \\
 & & & & & & \downarrow v^1 \\
 & & & & & & B
 \end{array}
 \tag{63}$$

Then $\Delta \circ \underline{f}$ is represented by the following diagram

$$\begin{array}{ccccc}
 & & D^1 & & \\
 & \swarrow w \circ w^1 & \uparrow t^1 \circ t^3 & \searrow g^1 \circ f^1 & \\
 A & & D^5 & & C, \\
 & \swarrow w \circ w^2 & \downarrow t^2 \circ t^4 & \searrow g^2 \circ f^2 & \\
 & & D^2 & &
 \end{array}$$

(64)

where ξ is the following composition:

$$\begin{array}{ccccccc}
 & & D^3 & \xrightarrow{t^1} & D^1 & \xrightarrow{f^1} & B^1 \\
 & \swarrow t^3 & \downarrow \delta & \searrow h^1 & \downarrow \sigma^1 & \searrow u^1 & \downarrow \beta \\
 D^5 & & & & & & C. \\
 & \swarrow t^4 & \downarrow h^2 & \searrow (\sigma^2)^{-1} & \downarrow & \searrow u^2 & \\
 & & D^4 & \xrightarrow{t^2} & D^2 & \xrightarrow{f^2} & B^2 \\
 & & & & & & \swarrow g^2
 \end{array}$$

(65)

Given any other representative (60) for Δ , and any other set of data as in (F5) – (F7), the diagram (64) induced by the new data represents the same 2-morphism as (64).

Therefore, each composition of the form $\Delta \circ \underline{f}$ does not depend on the set of choices $D(\mathbf{W})$.

6.2. REMARK. Since (60) represents a 2-morphism in a bicategory of fractions, both v^1 and $v^1 \circ u^1$ belong to \mathbf{W} , so by Lemma 2.2 there are data as on the left hand side of (62). Since α is an invertible 2-morphism of \mathcal{C} , by (BF5) also $v^2 \circ u^2$ belongs to \mathbf{W} ; since \underline{g}^2 is a morphism in $\mathcal{C}[\mathbf{W}^{-1}]$, v^2 belongs to \mathbf{W} . So using again Lemma 2.2 there are data as on the right hand side of (62), hence we can always find data satisfying condition (F5). By axiom (BF2) the composition $w^2 \circ t^2$ belongs to \mathbf{W} , hence a set of data as in (F6) exists by (BF3). Since $v^1 \circ u^1$ belongs to \mathbf{W} , a set of data as in (F7) exists by (BF4), up to replacing φ in (F6) with the composition of φ with a suitable morphism in \mathbf{W} with target in D^5 (this is analogous to the procedure explicitly described in Remark 4.3). So a set of data as in (F5) – (F7) exists, but in general it is not unique.

The proof of Proposition 6.1 relies on the following:

6.3. LEMMA. Let us assume the same notations as Proposition 6.1. Moreover, let us fix any set of data in \mathcal{C} as follows:

(F5)': we choose data as in the upper part of the following diagrams, with z^1 and z^2 in

\mathbf{W} , and γ^1 and γ^2 invertible:

$$\begin{array}{ccc}
 & E^3 & \\
 z^1 \swarrow & \gamma^1 & \searrow l^1 \\
 D^1 & \xrightarrow{f^1} & B^1 \xleftarrow{u^1} B^3, \\
 & \Downarrow \cong & \\
 & E^4 & \\
 z^2 \swarrow & \gamma^2 & \searrow l^2 \\
 D^2 & \xrightarrow{f^2} & B^2 \xleftarrow{u^2} B^3;
 \end{array} \tag{66}$$

(F6)': we choose any set of data as in the upper part of the following diagram, with z^3 in \mathbf{W} and ν invertible:

$$\begin{array}{ccc}
 & E^5 & \\
 z^3 \swarrow & \nu & \searrow z^4 \\
 E^3 & \xrightarrow{w^1 \circ z^1} & A' \xleftarrow{w^2 \circ z^2} E^4;
 \end{array}$$

(F7)': we choose any invertible 2-morphism $\eta : l^1 \circ z^3 \Rightarrow l^2 \circ z^4$, such that $v^1 \circ u^1 \circ \eta$ is equal to the following composition:

$$\begin{array}{ccccccc}
 & & & B^3 & & & \\
 & & & \nearrow l^1 & & \searrow u^1 & \\
 & & E^3 & \xrightarrow{z^1} & D^1 & \xrightarrow{f^1} & B^1 \\
 & & \downarrow \nu & & \downarrow (\gamma^1)^{-1} & & \downarrow (\rho^1)^{-1} \\
 E^5 & \xrightarrow{z^3} & E^3 & \xrightarrow{z^1} & D^1 & \xrightarrow{f^1} & B^1 \\
 & & \downarrow \nu & & \downarrow \gamma^1 & & \downarrow \alpha^{-1} \\
 & & E^4 & \xrightarrow{z^2} & D^2 & \xrightarrow{f^2} & B^2 \\
 & & \downarrow l^2 & & \downarrow \gamma^2 & & \downarrow \alpha^{-1} \\
 & & E^4 & \xrightarrow{z^2} & D^2 & \xrightarrow{f^2} & B^2 \\
 & & & \searrow l^2 & & \searrow u^2 & \\
 & & & & B^3 & \xrightarrow{u^1} & B^1
 \end{array}$$

(67)

Let ω be the following composition:

$$\begin{array}{ccccccc}
 & & & E^3 & \xrightarrow{z^1} & D^1 & \xrightarrow{f^1} & B^1 & & \\
 & & & \downarrow \eta & & \downarrow \gamma^1 & & \downarrow \beta & & \\
 E^5 & \xrightarrow{z^3} & E^3 & \xrightarrow{z^1} & D^1 & \xrightarrow{f^1} & B^1 & \xrightarrow{g^1} & C. \\
 & & \downarrow \eta & & \downarrow \gamma^1 & & \downarrow \beta & & \\
 & & E^4 & \xrightarrow{z^2} & D^2 & \xrightarrow{f^2} & B^2 & \xrightarrow{g^2} & C. \\
 & & \downarrow \eta & & \downarrow \gamma^2 & & \downarrow \beta & & \\
 & & E^4 & \xrightarrow{z^2} & D^2 & \xrightarrow{f^2} & B^2 & \xrightarrow{g^2} & C.
 \end{array}$$

(68)

Then the following diagram

$$\begin{array}{ccccc}
 & & D^1 & & \\
 & \swarrow^{w \circ w^1} & \uparrow^{z^1 \circ z^3} & \searrow^{g^1 \circ f^1} & \\
 A & \xleftarrow{\quad} & E^5 & \xrightarrow{\quad} & C \\
 & \searrow_{w \circ w^2} & \downarrow^{z^2 \circ z^4} & \swarrow_{g^2 \circ f^2} & \\
 & & D^2 & &
 \end{array}
 \quad \Downarrow_{w \circ \nu}$$

(69)

represents the same 2-cell of $\mathcal{C}[\mathbf{W}^{-1}]$ as (64).

PROOF. **Step 1.** Let us apply Lemma 3.1 on the following pair of diagrams:

$$\begin{array}{ccc}
 & D^1 & \\
 & \swarrow^{w^1} & \uparrow^{t^1 \circ t^3} \\
 A' & \xleftarrow{\quad} & D^5 \\
 & \searrow_{w^2} & \downarrow^{t^2 \circ t^4} \\
 & & D^2
 \end{array}
 \quad \Downarrow_{\varphi}
 \qquad
 \begin{array}{ccc}
 & D^1 & \\
 & \swarrow^{w^1} & \uparrow^{z^1 \circ z^3} \\
 A' & \xleftarrow{\quad} & E^5 \\
 & \searrow_{w^2} & \downarrow^{z^2 \circ z^4} \\
 & & D^2
 \end{array}
 \quad \Downarrow_{\nu}$$

Then there are a pair of objects F^1 and F^2 , a triple of morphisms p^1 , p^2 and p^3 , such that both $t^1 \circ t^3 \circ p^1$ and p^3 belong to \mathbf{W} , and a pair of invertible 2-morphisms ε and κ in \mathcal{C} as follows:

$$\begin{array}{ccc}
 & F^1 & \\
 & \swarrow^{p^1} & \searrow^{p^2} \\
 D^5 & \xrightarrow{t^1 \circ t^3} & D^1 \xleftarrow{z^1 \circ z^3} E^5, \\
 & \Downarrow_{\varepsilon} &
 \end{array}
 \qquad
 \begin{array}{ccc}
 & F^2 & \\
 & \swarrow^{p^3} & \searrow^{p^3} \\
 F^1 & \xrightarrow{z^2 \circ z^4 \circ p^2} & D^2 \xleftarrow{t^2 \circ t^4 \circ p^1} F^1, \\
 & \Downarrow_{\kappa} &
 \end{array}$$

such that $\varphi \circ p^1 \circ p^3$ is equal to the following composition:

$$\begin{array}{ccccccc}
 & & F^1 & \xrightarrow{p^1} & D^5 & \xrightarrow{t^1 \circ t^3} & D^1 \\
 & & \searrow^{p^2} & & \downarrow \varepsilon & \xrightarrow{z^1 \circ z^3} & \downarrow \nu \\
 & & E^5 & \xrightarrow{z^2 \circ z^4} & D^2 & \xrightarrow{w^1} & A' \\
 & \swarrow^{p^3} & \downarrow \kappa & \swarrow^{p^1} & \downarrow^{z^2 \circ z^4} & \searrow_{w^2} & \\
 F^2 & \xrightarrow{p^3} & F^1 & \xrightarrow{p^1} & D^5 & \xrightarrow{t^2 \circ t^4} & D^2 \xrightarrow{w^2} A'.
 \end{array}
 \quad (70)$$

in \mathcal{C} , such that $\varsigma \circ p^4 = u^2 \circ \tilde{\varsigma}$. ς is invertible since each 2-morphism in (77) is invertible in \mathcal{C} ; then using again Lemma 2.3, we get that also $\tilde{\varsigma}$ is invertible. Using the definition of ς in (77) and the fact that $\varsigma \circ p^4 = u^2 \circ \tilde{\varsigma}$, we get that the composition

$$\begin{array}{ccccccc}
 & & p^3 & \nearrow & F^1 & \xrightarrow{p^1} & D^5 & \xrightarrow{t^4} & D^4 & \xrightarrow{t^2} & D^2 & \xrightarrow{f^2} & B^2 \\
 F^3 & \xrightarrow{p^4} & F^2 & & & \downarrow \kappa^{-1} & & & & & & & \\
 & & p^3 & \searrow & F^1 & \xrightarrow{p^2} & E^5 & \xrightarrow{z^4} & E^4 & \xrightarrow{z^2} & D^2 & & \\
 & & & & & & & & & \searrow l^2 & \downarrow \gamma^2 & \nearrow u^2 & \\
 & & & & & & & & & & B^3 & &
 \end{array}
 \tag{79}$$

is equal to the following one:

$$\begin{array}{ccccccc}
 & & & & D^5 & \xrightarrow{t^4} & D^4 & \xrightarrow{t^2} & D^2 & \xrightarrow{f^2} & B^2 \\
 & & p^3 \circ p^4 & \nearrow & F^1 & & \downarrow \tilde{\varsigma} & & & & \\
 F^3 & \xrightarrow{p^3 \circ p^4} & F^1 & & & & & \xrightarrow{h^2} & D^2 & & \\
 & & p^3 \circ p^4 & \searrow & F^1 & \xrightarrow{p^2} & E^5 & \xrightarrow{z^4} & E^4 & \xrightarrow{l^2} & B^3 & \nearrow u^2 & \\
 & & & & & & & & & & & &
 \end{array}
 \tag{80}$$

Step 6. Let μ be the following composition:

$$\begin{array}{ccccccc}
 & & & & D^5 & \xrightarrow{t^3} & D^3 & \xrightarrow{t^1} & D^1 & \xrightarrow{f^1} & B^1 \\
 F^3 & \xrightarrow{p^4} & F^2 & \xrightarrow{p^3} & F^1 & \xrightarrow{p^1} & D^5 & & \downarrow \varepsilon & & \\
 & & & & & \searrow p^2 & E^5 & \xrightarrow{z^3} & E^3 & \xrightarrow{z^1} & D^1 & & \\
 & & & & & & & \xrightarrow{z^4} & E^4 & \xrightarrow{l^1} & D^1 & & \\
 & & & & & & & & & \downarrow \eta & \downarrow \gamma^1 & & \\
 & & & & & & & & & & B^3 & \xrightarrow{u^1} & B^1
 \end{array}
 \tag{81}$$

Let us consider the 2-morphism $v^1 \circ \mu$: we use (67) and we simplify γ^1 (coming from (81)) with its inverse (coming from (67)), so we get that $v^1 \circ \mu$ is equal to the following composition:

In the previous diagram we can replace (75) with (76), so we get that $v^1 \circ \mu$ coincides also with the following composition:

In the previous diagram we can replace (79) with (80). So we conclude that $v^1 \circ \mu$ coincides also with the following composition:

replace (84) with (83), we conclude that $\zeta \circ p^4 \circ p^5$ is equal to the following composition:

(85)

In the diagram above we replace $u^2 \circ \tilde{\zeta}$ with $\zeta \circ p^4$ (see (78)), then we replace ζ with diagram (77). Lastly, we simplify γ^2 and κ^{-1} (coming from (77)) with their inverses (coming from (85)). So we conclude that $\zeta \circ p^4 \circ p^5$ coincides also with the following composition:

If we compare this with the definition of ξ in (65), we conclude that:

$$\zeta \circ (p^4 \circ p^5) = (\xi \circ p^1 \circ p^3) \circ (p^4 \circ p^5).$$

Step 8. Since both p^4 and p^5 belong to \mathbf{W} , so does their composition by (BF2). So the previous identity together with Lemma 3.4(ii) proves that (72) and (73) are equivalent diagrams, so we have proved the claim (see Step 3). ■

PROOF OF PROPOSITION 6.1. Following [P1996, pp. 259–261], in order to compute $\Delta \circ \underline{f}$ one can choose freely any representative for Δ as in (60) (and the result does not depend on this choice). Then after a very long construction, one gets a set of data satisfying conditions (F5) – (F7) and some additional properties, that we don't need to recall here. Such data are uniquely determined by the choices of type $\mathbf{C}(\mathbf{W})$ and $\mathbf{D}(\mathbf{W})$. Then the construction of $\Delta \circ \underline{f}$ in [P1996] is simply a special case of the construction described in

Proposition 6.1, with a special set of data (F5) – (F7), Using Lemma 6.3, any set of data (F5) – (F7) gives the same 2-cell of $\mathcal{C}[\mathbf{W}^{-1}]$, so we conclude. ■

7. Horizontal composition with 1-morphisms on the right

7.1. PROPOSITION. (**horizontal composition with 1-morphisms on the right**) *Let us fix any morphism $\underline{g} = (B', u, g) : B \rightarrow C$, any pair of morphisms $\underline{f}^m := (A^m, w^m, f^m) : A \rightarrow B$ for $m = 1, 2$ and any 2-morphism $\Gamma : \underline{f}^1 \Rightarrow \underline{f}^2$ in $\mathcal{C}[\mathbf{W}^{-1}]$. Let us fix any representative for Γ as in (4) and let us suppose that the set of choices $\mathbf{C}(\mathbf{W})$ gives data as in the upper part of the following diagrams, with u^1 and u^2 in \mathbf{W} , and ρ^1 and ρ^2 invertible*

$$\begin{array}{ccc}
 & D^1 & \\
 u^1 \swarrow & \rho^1 & \searrow h^1 \\
 A^1 & \xrightarrow{f^1} B & \xleftarrow{u} B'
 \end{array}
 \qquad
 \begin{array}{ccc}
 & D^2 & \\
 u^2 \swarrow & \rho^2 & \searrow h^2 \\
 A^2 & \xrightarrow{f^2} B & \xleftarrow{u} B'
 \end{array}
 \tag{86}$$

(so that by [P1996, § 2.2] we have $\underline{g} \circ \underline{f}^m = (D^m, w^m \circ u^m, g \circ h^m)$ for $m = 1, 2$). Then let us fix any set of data in \mathcal{C} as follows:

(F8): we choose data as in the upper part of the following diagrams, with u^3 and u^5 in \mathbf{W} , and η^1 and η^2 invertible:

$$\begin{array}{ccc}
 & D^3 & \\
 u^3 \swarrow & \eta^1 & \searrow u^4 \\
 A^3 & \xrightarrow{v^1} A^1 & \xleftarrow{u^1} D^1,
 \end{array}
 \qquad
 \begin{array}{ccc}
 & D^4 & \\
 u^5 \swarrow & \eta^2 & \searrow u^6 \\
 A^3 & \xrightarrow{v^2} A^2 & \xleftarrow{u^2} D^2;
 \end{array}$$

(F9): we choose data as in the upper part of the following diagram, with u^7 in \mathbf{W} and η^3 invertible:

$$\begin{array}{ccc}
 & D^5 & \\
 u^7 \swarrow & \eta^3 & \searrow u^8 \\
 D^3 & \xrightarrow{u^3} A^3 & \xleftarrow{u^5} D^4;
 \end{array}$$

up to replacing η^3 with the composition of η^3 with a suitable morphism in \mathbf{W} with target in D^5 (analogously to the construction explained in Remark 4.3).

The proof of Proposition 7.1 relies on the following:

7.3. LEMMA. *Let us assume the same notations as Proposition 7.1. Moreover, let us fix any set of data in \mathcal{C} as follows:*

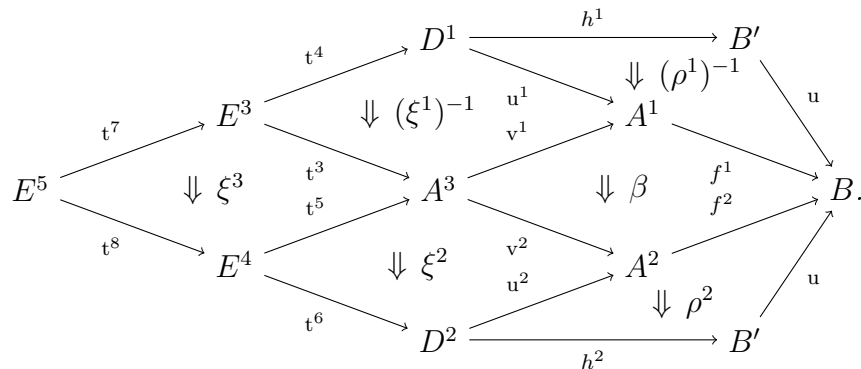

(F8)’: *we choose data as in the upper part of the following diagrams, with t^3 and t^5 in \mathbf{W} , and ξ^1 and ξ^2 invertible:*

(F9)’: *we choose data as in the upper part of the following diagram, with t^7 in \mathbf{W} and ξ^3 invertible:*

(F10)’: *we choose any 2-morphism $\varphi : h^1 \circ t^4 \circ t^7 \Rightarrow h^2 \circ t^6 \circ t^8$, such that $u \circ \varphi$ is equal to the following composition:*

Step 4. Now let us consider the 2-morphism of \mathcal{C}

$$\mu \circ r^1 \circ r^3 \circ q^1 \circ q^3 \circ q^4, \tag{102}$$

where μ defined in (89). Replacing (93) with (94), (96) with (97), and simplifying τ with τ^{-1} , we get that (102) is equal to the following composition:

Comparing with the definition of δ in (90), we conclude that (102) is also equal to the following composition:

$$\tag{103}$$

Step 5. Now let ε be the composition

and let κ be the composition

by the quintuple $(A^4, v^1 \circ u, v^2 \circ u, \alpha \circ u, \beta \circ u)$. Since $\beta \circ u$ is invertible in \mathcal{C} , (ii) holds with this new representative for Γ .

Now let us assume (ii), so let us assume that the data in (4) are such that β is invertible in \mathcal{C} . Since α is invertible in \mathcal{C} by definition of 2-morphism in a bicategory of fractions, it makes sense to consider the 2-morphism $[A^3, v^2, v^1, \alpha^{-1}, \beta^{-1}] : \underline{f^2} \Rightarrow \underline{f^1}$. Using Proposition 5.1, it is easy to see that this is a (vertical) inverse for Γ , so (i) holds.

Now let us prove that (i) implies (iv), so let us assume that Γ is invertible and let us fix any representative (4) for it; by definition of 2-morphism in $\mathcal{C}[\mathbf{W}^{-1}]$ we have that α is invertible, so we can apply Corollary 3.3 with $\underline{f^1}$ interchanged with $\underline{f^2}$ and $(E, p, q, \varsigma, \Phi)$ replaced by $(A^3, v^2, v^1, \alpha^{-1}, \Gamma^{-1})$. So there are an object E , a morphism $r : E \rightarrow A^3$ such that $v^2 \circ r$ belongs to \mathbf{W} , and a 2-morphism $\varphi : f^2 \circ v^2 \circ r \Rightarrow f^1 \circ v^1 \circ r$, such that Γ^{-1} is represented by the following diagram:

$$\begin{array}{ccccc}
 & & A^2 & & \\
 & \swarrow w^2 & \uparrow v^2 \circ r & \searrow f^2 & \\
 A & & E & & B \\
 & \swarrow w^1 & \downarrow v^1 \circ r & \searrow f^1 & \\
 & & A^1 & &
 \end{array}$$

Then we have

$$\begin{aligned}
 & \left[E, v^2 \circ r, v^2 \circ r, i_{w^2 \circ v^2 \circ r}, i_{f^2 \circ v^2 \circ r} \right] = i_{(A^2, w^2, f^2)} = \\
 & = \Gamma \circ \Gamma^{-1} \stackrel{(*)}{=} \left[E, v^2 \circ r, v^2 \circ r, i_{w^2 \circ v^2 \circ r}, (\beta \circ r) \circ \varphi \right],
 \end{aligned}$$

where $(*)$ is obtained by applying Proposition 5.1. So by Lemma 3.4(ii) there are an object F and a morphism $s : F \rightarrow E$ in \mathbf{W} , such that:

$$i_{f^2 \circ v^2 \circ r \circ s} = (\beta \circ r \circ s) \circ (\varphi \circ s). \quad (104)$$

Analogously, we have:

$$\begin{aligned}
 & \left[F, v^1 \circ r \circ s, v^1 \circ r \circ s, i_{w^1 \circ v^1 \circ r \circ s}, i_{f^1 \circ v^1 \circ r \circ s} \right] = i_{(A^1, w^1, f^1)} = \\
 & = \Gamma^{-1} \circ \Gamma \stackrel{(*)}{=} \left[F, v^1 \circ r \circ s, v^1 \circ r \circ s, i_{w^1 \circ v^1 \circ r \circ s}, (\varphi \circ s) \circ (\beta \circ r \circ s) \right],
 \end{aligned}$$

where $(*)$ is obtained using again Proposition 5.1. So by Lemma 3.4(iii) there are an object A^4 and a morphism $t : A^4 \rightarrow F$, such that $v^1 \circ r \circ s \circ t$ belongs to \mathbf{W} and such that

$$i_{f^1 \circ v^1 \circ r \circ s \circ t} = (\varphi \circ s \circ t) \circ (\beta \circ r \circ s \circ t). \quad (105)$$

Then (104) and (105) prove that $\beta \circ r \circ s \circ t$ has an inverse in \mathcal{C} , given by $\varphi \circ s \circ t$. In order to conclude that (iv) holds, it suffices to define $u := r \circ s \circ t : A^4 \rightarrow A^3$. ■

A second application of the results of the previous sections is the following corollary, that will be useful in the next paper [T2014(a)]. In that paper, we will have to compare the compositions of 3 morphisms of the form (27) and the compositions of 3 morphisms of the following form

$$\begin{aligned} \underline{f}' &:= \left(A \xleftarrow{u \circ \text{id}_{A'}} A' \xrightarrow{f \circ \text{id}_{A'}} B \right), \\ \underline{g}' &:= \left(B \xleftarrow{v \circ \text{id}_{B'}} B' \xrightarrow{g \circ \text{id}_{B'}} C \right), \\ \underline{h}' &:= \left(C \xleftarrow{w \circ \text{id}_{C'}} C' \xrightarrow{h \circ \text{id}_{C'}} D \right). \end{aligned} \tag{106}$$

In the special case when \mathcal{C} is a 2-category we have that $\underline{f} = \underline{f}'$ and so on, hence $\underline{h} \circ (\underline{g} \circ \underline{f}) = \underline{h}' \circ (\underline{g}' \circ \underline{f}')$ and $(\underline{h} \circ \underline{g}) \circ \underline{f} = (\underline{h}' \circ \underline{g}') \circ \underline{f}'$. However, when \mathcal{C} is simply a bicategory, in general the fixed choice (A^1, u^1, f^1, δ) in the set $\mathbf{C}(\mathbf{W})$ for the pair (f, v) (see the first diagram in (28)) is different from the fixed choice for the pair $(f \circ \text{id}_{A'}, v \circ \text{id}_{B'})$, and analogously for all the remaining choices needed to compose the morphisms in (106). Therefore, we need a tool for comparing $\underline{h}' \circ (\underline{g}' \circ \underline{f}')$ with $\underline{h} \circ (\underline{g} \circ \underline{f})$ and analogously for the other pair of compositions. In order to do that, first of all we compare separately \underline{f}' with \underline{f} . For that, we recall that we are denoting by $\pi_a : a \circ \text{id}_A \Rightarrow a$ the right unitor of \mathcal{C} for any morphism $a : A \rightarrow B$. Then we define an invertible 2-morphism $\chi(\underline{f}) : \underline{f}' \Rightarrow \underline{f}$ as the class of the following diagram

and analogously for $\chi(\underline{g})$ and $\chi(\underline{h})$. Then we have the following result:

8.1. COROLLARY. *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF) and any set of 6 morphisms as in (27) and (106). Then the associator $\Theta_{\underline{h}, \underline{g}, \underline{f}}^{\mathcal{C}, \mathbf{W}} : \underline{h} \circ (\underline{g} \circ \underline{f}) \Rightarrow (\underline{h} \circ \underline{g}) \circ \underline{f}$*

is equal to the following composition:

$$\begin{array}{ccc}
 & \xrightarrow{\underline{g \circ f}} & C \\
 \downarrow \chi(\underline{g})^{-1} \circ \chi(\underline{f})^{-1} & & \downarrow \chi(\underline{h})^{-1} \\
 A & \xrightarrow{\underline{g' \circ f'}} & D \\
 \downarrow \chi(\underline{f}) & \Downarrow \Theta_{\underline{h'}, \underline{g'}, \underline{f'}}^{\mathcal{C}, \mathbf{W}} & \downarrow \chi(\underline{h}) \circ \chi(\underline{g}) \\
 & \xrightarrow{\underline{f}} & B \\
 & & \xrightarrow{\underline{h \circ g}}
 \end{array}
 \tag{107}$$

8.2. REMARK. As we mentioned above, in the case when \mathcal{C} is a 2-category there is nothing to prove (since $\chi(\underline{f})$, $\chi(\underline{g})$ and $\chi(\underline{h})$ are all trivial). In the case of a bicategory, things are a bit more complicated. One could be tempted to do the following:

- (a) prove that $\chi(\underline{f})$ is a right or left unitor for \underline{f} in the bicategory $\mathcal{C}[\mathbf{W}^{-1}]$, and analogously for $\chi(\underline{g})$ and $\chi(\underline{h})$;
- (b) appeal to coherence results in order to conclude that necessarily the composition in (107) coincides with the associator $\Theta_{\underline{h}, \underline{g}, \underline{f}}^{\mathcal{C}, \mathbf{W}}$.

However, since the identities for A and B in $\mathcal{C}[\mathbf{W}^{-1}]$ are the triples $(A, \text{id}_A, \text{id}_A)$ and $(B, \text{id}_B, \text{id}_B)$ respectively, we have:

$$\underline{f} \circ \text{id}_A = \left(A \xleftarrow{\text{id}_A \circ \text{u}} A' \xrightarrow{\underline{f} \circ \text{id}_{A'}} B \right), \quad \text{id}_B \circ \underline{f} = \left(A \xleftarrow{\text{u} \circ \text{id}_{A'}} A' \xrightarrow{\text{id}_B \circ \underline{f}} B \right).$$

Since we are working in a bicategory, in general $\text{id}_A \circ \text{u} \neq \text{u} \circ \text{id}_{A'}$ and $\text{id}_B \circ \underline{f} \neq \underline{f} \circ \text{id}_{A'}$, therefore in general \underline{f}' is different from $\underline{f} \circ \text{id}_A$ and from $\text{id}_B \circ \underline{f}$. Therefore in general $\chi(\underline{f}) : \underline{f}' \Rightarrow \underline{f}$ cannot be a left or right unitor for \underline{f} in $\mathcal{C}[\mathbf{W}^{-1}]$. So in general we cannot use (a) (then (b)) in order to conclude. Instead, we need to rely on Propositions 4.1, 5.1 and 7.1, as we will show below.

PROOF OF COROLLARY 8.1. The main problem in the proof comes from the presence of unitors for \mathcal{C} (with trivial unitors, the statement is trivial). The presence of associators of \mathcal{C} complicates only the exposition of the proof, but it does not introduce additional problems. So for simplicity of exposition we suppose that \mathcal{C} has trivial associators.

Step 1. Let us denote as in (28) the fixed choices in the set $\mathbf{C}(\mathbf{W})$, needed for composition of \underline{f} , \underline{g} and \underline{h} , so that we have identities (29) and (30). Moreover, let us suppose that the set of fixed choices $\mathbf{C}(\mathbf{W})$ gives data as in the upper part of the following diagrams (starting from the ones on the left), with \bar{u}^1 , \bar{u}^2 , \bar{v}^1 and \bar{u}^3 in \mathbf{W} , and $\bar{\delta}$, $\bar{\sigma}$, $\bar{\xi}$ and $\bar{\eta}$ invertible:

$$\begin{array}{ccc}
\begin{array}{ccc}
& \bar{A}^1 & \\
\bar{u}^1 \swarrow & \bar{\delta} \Downarrow & \searrow \bar{f}^1 \\
A' & \xrightarrow{f \circ \text{id}_{A'}} B & \xleftarrow{v \circ \text{id}_{B'}} B'
\end{array} & & \begin{array}{ccc}
& \bar{A}^2 & \\
\bar{u}^2 \swarrow & \bar{\sigma} \Downarrow & \searrow \bar{l} \\
\bar{A}^1 & \xrightarrow{g \circ \text{id}_{B'} \circ \bar{f}^1} C & \xleftarrow{w \circ \text{id}_{C'}} C'
\end{array} \\
\\
\begin{array}{ccc}
& \bar{B}^2 & \\
\bar{v}^1 \swarrow & \bar{\xi} \Downarrow & \searrow \bar{g}^1 \\
B' & \xrightarrow{g \circ \text{id}_{B'}} C & \xleftarrow{w \circ \text{id}_{C'}} C'
\end{array} & & \begin{array}{ccc}
& \bar{A}^3 & \\
\bar{u}^3 \swarrow & \bar{\eta} \Downarrow & \searrow \bar{f}^2 \\
A' & \xrightarrow{f \circ \text{id}_{A'}} B & \xleftarrow{v \circ \text{id}_{B'} \circ \bar{v}^1} \bar{B}^2
\end{array}
\end{array} \tag{108}$$

so that by [P1996, § 2.2] one has

$$\begin{aligned}
\underline{h}' \circ (\underline{g}' \circ \underline{f}') &= \left(A \xleftarrow{u \circ \text{id}_{A'} \circ \bar{u}^1 \circ \bar{u}^2} \bar{A}^2 \xrightarrow{h \circ \text{id}_{C'} \circ \bar{l}} D \right), \\
(\underline{h}' \circ \underline{g}') \circ \underline{f}' &= \left(A \xleftarrow{u \circ \text{id}_{A'} \circ \bar{u}^3} \bar{A}^3 \xrightarrow{h \circ \text{id}_{C'} \circ \bar{g}^1 \circ \bar{f}^2} D \right).
\end{aligned}$$

Step 2. In this long step we are going to construct a set of data in \mathcal{C} ; such data will be used in order to provide representatives for the various 2-morphisms appearing in the claim of Corollary 8.1, in such a way that it will be simple to compute their composition in (107), and to prove that it coincides with $\Theta_{\underline{h}, \underline{g}, \underline{f}}^{\mathcal{C}, \mathbf{W}}$.

Step 2a. Using (BF2) we get that $\bar{u}^1 \circ \bar{u}^2$ belongs to \mathbf{W} , so by (BF3) there is a set of data as in the upper part of the following diagram, with r^1 in \mathbf{W} and ζ^1 invertible:

$$\begin{array}{ccc}
& E^1 & \\
r^1 \swarrow & \zeta^1 \Downarrow & \searrow r^2 \\
A^2 & \xrightarrow{u^1 \circ u^2} A' & \xleftarrow{\bar{u}^1 \circ \bar{u}^2} \bar{A}^2
\end{array} \tag{109}$$

Using (BF4a) and (BF4b), there are an object E^2 , a morphism $r^3 : E^2 \rightarrow E^1$ in \mathbf{W} and an invertible 2-morphism $\varepsilon^1 : f^1 \circ u^2 \circ r^1 \circ r^3 \Rightarrow \bar{f}^1 \circ \bar{u}^2 \circ r^2 \circ r^3$ in \mathcal{C} , such that $v \circ \varepsilon^1$ is equal to the following composition:

This implies that $\delta^{-1} \circ u^2 \circ r^1 \circ r^3$ is equal to the following composition:

(110)

Step 2b. Now we use again (BF4a) and (BF4b) in order to get an object E^3 , a morphism $r^4 : E^3 \rightarrow E^2$ in \mathbf{W} and an invertible 2-morphism $\varepsilon^2 : l \circ r^1 \circ r^3 \circ r^4 \Rightarrow \bar{l} \circ r^2 \circ r^3 \circ r^4$, such that $w \circ \varepsilon^2$ is equal to the following composition:

Therefore, $\sigma^{-1} \circ r^1 \circ r^3 \circ r^4$ is equal to the following composition:

(111)

Step 2c. We use (BF3) in order to get data as in the upper part of the following diagram, with r^5 in \mathbf{W} and ζ^2 invertible:

$$\begin{array}{ccc} & E^4 & \\ r^5 \swarrow & \zeta^2 & \searrow r^6 \\ A^3 & \xrightarrow{u^3} & A' \xleftarrow{\bar{u}^3} \bar{A}^3 \end{array}$$

Using (BF4a) and (BF4b), there are an object E^5 , a morphism $r^7 : E^5 \rightarrow E^4$ in \mathbf{W} and an invertible 2-morphism $\varepsilon^3 : v^1 \circ f^2 \circ r^5 \circ r^7 \Rightarrow \bar{v}^1 \circ \bar{f}^2 \circ r^6 \circ r^7$ in \mathcal{C} , such that $v \circ \varepsilon^3$ is equal to the following composition:

$$\begin{array}{ccccccc} & & A^3 & \xrightarrow{f^2} & B^2 & \xrightarrow{v^1} & B' & \xrightarrow{v} & B \\ E^5 & \xrightarrow{r^7} & E^4 & \begin{array}{l} \nearrow r^5 \\ \searrow r^6 \end{array} & \begin{array}{l} \downarrow \zeta^2 \\ \downarrow \eta^{-1} \end{array} & & & & \\ & & A^3 & \xrightarrow{u^3} & A' & \xrightarrow{f} & B & & \\ & & \bar{A}^3 & \xrightarrow{\bar{f}^2} & \bar{B}^2 & \xrightarrow{\bar{v}^1} & B' & \xrightarrow{v \circ \text{id}_{B'}} & B \\ & & & & & \downarrow \bar{\eta} & & \downarrow \pi_v & \end{array}$$

Therefore, $\eta \circ r^5 \circ r^7$ is equal to the following composition:

$$\begin{array}{ccccccc} E^5 & \xrightarrow{r^7} & E^4 & \begin{array}{l} \xrightarrow{r^5} \\ \xrightarrow{r^6} \end{array} & A^3 & \xrightarrow{u^3} & A' & \xrightarrow{f} & B \\ & \searrow r^7 & E^4 & \begin{array}{l} \downarrow \zeta^2 \\ \downarrow (\varepsilon^3)^{-1} \end{array} & \bar{A}^3 & \xrightarrow{\bar{u}^3} & A' & \xrightarrow{f \circ \text{id}_{A'}} & B \\ & & & & A^3 & \xrightarrow{f^2} & B^2 & \xrightarrow{v^1} & B' & \xrightarrow{v} & B \\ & & & & & \downarrow \bar{\eta} & & \downarrow \pi_v & & & \end{array} \quad (112)$$

Step 2d. Using (BF2) we get that $u^3 \circ r^5 \circ r^7$ belongs to \mathbf{W} ; so by (BF3) there are data as in the upper part of the following diagram, with r^8 in \mathbf{W} and ζ^3 invertible:

$$\begin{array}{ccc} & E^6 & \\ r^8 \swarrow & \zeta^3 & \searrow r^9 \\ E^3 & \xrightarrow{u^1 \circ u^2 \circ r^1 \circ r^3 \circ r^4} & A' \xleftarrow{u^3 \circ r^5 \circ r^7} E^5 \end{array}$$

Then we use (BF4a) and (BF4b) in order to get an object E^7 , a morphism $r^{10} : E^7 \rightarrow E^6$ in \mathbf{W} and an invertible 2-morphism $\varepsilon^4 : \bar{f}^1 \circ \bar{u}^2 \circ r^2 \circ r^3 \circ r^4 \circ r^8 \circ r^{10} \Rightarrow \bar{v}^1 \circ \bar{f}^2 \circ$

$g^1 \circ f^2 \circ r^5 \circ r^7 \circ r^9 \circ r^{10} \circ r^{11} \circ r^{12}$, such that $w \circ \rho$ is equal to the following composition:

$$\begin{array}{ccccccc}
& & E^3 & \xrightarrow{r^1 \circ r^3 \circ r^4} & A^2 & \xrightarrow{l} & C' \\
& \nearrow^{r^8 \circ r^{10}} & \downarrow \varepsilon^4 & \searrow^{r^2 \circ r^3 \circ r^4} & \downarrow \varepsilon^2 & \nearrow^{\bar{l}} & \downarrow \pi_w^{-1} \\
& & & & \bar{A}^2 & & \\
& & & & \downarrow \bar{f}^1 \circ \bar{u}^2 & \downarrow \bar{\sigma}^{-1} & w \circ \text{id}_{C'} \\
E^7 & \xrightarrow{\bar{f}^2 \circ r^6 \circ r^7 \circ r^9 \circ r^{10}} & \bar{B}^2 & \xrightarrow{\bar{v}^1} & B' & \xrightarrow{g \circ \text{id}_{B'}} & C \\
& \downarrow (\varepsilon^5)^{-1} & & \searrow^{\bar{g}^1} & \downarrow \bar{\xi} & \nearrow^{w \circ \text{id}_{C'}} & \\
& & & & & & \\
A^4 & \xrightarrow{r^{12}} & E^8 & \xrightarrow{r^9 \circ r^{10} \circ r^{11}} & E^5 & \xrightarrow{r^5 \circ r^7} & A^3 & \xrightarrow{f^2} & B^2 & \xrightarrow{g^1} & C' \\
& & & & & & & & & \downarrow \pi_w & \\
& & & & & & & & & & w
\end{array}
\tag{115}$$

Step 3. Now we define the following set of morphisms and 2-morphisms:

$$\begin{aligned}
u^4 &:= r^1 \circ r^3 \circ r^4 \circ r^8 \circ r^{10} \circ r^{11} \circ r^{12} : A^4 \longrightarrow A^2, \\
u^5 &:= r^5 \circ r^7 \circ r^9 \circ r^{10} \circ r^{11} \circ r^{12} : A^4 \longrightarrow A^3, \\
\gamma &:= \zeta^3 \circ r^{10} \circ r^{11} \circ r^{12} : u^1 \circ u^2 \circ u^4 \Longrightarrow u^3 \circ u^5.
\end{aligned}
\tag{116}$$

Moreover, we define $\omega : f^1 \circ u^2 \circ u^4 \Rightarrow v^1 \circ f^2 \circ u^5$ as the following composition:

$$\begin{array}{ccccccc}
& & & & E^2 & \xrightarrow{r^1 \circ r^3} & A^2 & \xrightarrow{u^2} & A^1 \\
& & \nearrow^{r^4 \circ r^8 \circ r^{10}} & & \downarrow \varepsilon^4 & \searrow^{\bar{f}^1 \circ \bar{u}^2 \circ r^2 \circ r^3} & \downarrow \varepsilon^1 & \downarrow f^1 & \\
A^4 & \xrightarrow{r^{11} \circ r^{12}} & E^7 & & & & & & B' \\
& \searrow^{r^9 \circ r^{10}} & & & \nearrow^{\bar{v}^1 \circ \bar{f}^2 \circ r^6 \circ r^7} & & \downarrow (\varepsilon^3)^{-1} & \uparrow v^1 & \\
& & & & E^5 & \xrightarrow{r^5 \circ r^7} & A^3 & \xrightarrow{f^2} & B^2
\end{array}
\tag{117}$$

By construction of u^4 and u^5 , we have that ρ is defined from $l \circ u^4$ to $g^1 \circ f^2 \circ u^5$. We claim that the set of data

$$A^4, u^4, u^5, \gamma, \omega, \rho$$

satisfies conditions (F1) – (F3) for the computation of the associator $\Theta_{h,g,f}^{\mathcal{C}, \mathbf{W}}$. u^4 belongs to \mathbf{W} by construction and (BF2), and γ is invertible because ζ^3 is so, hence condition (F1) holds. In order to prove (F2), we replace in (31) the definition of u^4 , u^5 and γ (see (116)), the expression for $\delta^{-1} \circ u^2 \circ r^1 \circ r^3$ (obtained in diagram (110)) and the expression for $\eta \circ r^5 \circ r^7$ (obtained in diagram (112)). After simplifying the term π_f (coming from

(110)) with its inverse (coming from (112)), we get that the composition in (31) is equal to the following one:

(118)

Using (113) and (117), we get that (118) (hence (31)) coincides with $v \circ \omega$. This implies that (F2) holds. In order to prove (F3), in (32) we replace ω with its definition in (117), u^4 and u^5 with their definition in (116), $\sigma^{-1} \circ r^1 \circ r^3 \circ r^4$ with (111), and $\xi \circ f^2 \circ r^5 \circ r^7 \circ r^9 \circ r^{10} \circ r^{11}$ with (114). After simplifying the terms π_g , ε^1 and ε^3 with their inverses, we get that the composition in (32) coincides with (115), hence with $w \circ \rho$. Therefore also condition (F3) holds. So using Proposition 4.1 we conclude that the associator $\Theta_{\underline{h}, \underline{g}, \underline{f}}^{\mathcal{E}, \mathbf{W}}$ is represented by the following diagram:

(119)

Step 4. Now we want to compute also the associator $\Theta_{\underline{h}', \underline{g}', \underline{f}'}^{\mathcal{E}, \mathbf{W}}$. For that, we define the following set of data:

$$\begin{aligned}
 \bar{u}^4 &:= r^2 \circ r^3 \circ r^4 \circ r^8 \circ r^{10} \circ r^{11} \circ r^{12} : A^4 \longrightarrow \bar{A}^2, \\
 \bar{u}^5 &:= r^6 \circ r^7 \circ r^9 \circ r^{10} \circ r^{11} \circ r^{12} : A^4 \longrightarrow \bar{A}^3, \\
 \bar{w} &:= \varepsilon^4 \circ r^{11} \circ r^{12} : \bar{f}^1 \circ \bar{u}^2 \circ \bar{u}^4 \implies \bar{v}^1 \circ \bar{f}^2 \circ \bar{u}^5.
 \end{aligned}
 \tag{120}$$

we get that the associator $\Theta_{\underline{h}', \underline{g}', \underline{f}'}^{\mathcal{C}, \mathbf{W}}$ is represented by the following diagram:

$$\begin{array}{ccccc}
 & & \overline{A}^2 & & \\
 & \swarrow & \uparrow & \searrow & \\
 A & & A^4 & & D. \\
 & \swarrow & \downarrow & \searrow & \\
 & & \overline{A}^3 & &
 \end{array}
 \begin{array}{l}
 \text{u} \circ \text{id}_{A'} \circ \overline{\text{u}}^1 \circ \overline{\text{u}}^2 \\
 \downarrow \text{u} \circ \text{id}_{A'} \circ \overline{\gamma} \\
 \text{u} \circ \text{id}_{A'} \circ \overline{\text{u}}^3 \\
 \text{r}^2 \circ \text{r}^3 \circ \text{r}^4 \circ \text{r}^8 \circ \text{r}^{10} \circ \text{r}^{11} \circ \text{r}^{12} \\
 \text{r}^6 \circ \text{r}^7 \circ \text{r}^9 \circ \text{r}^{10} \circ \text{r}^{11} \circ \text{r}^{12} \\
 h \circ \text{id}_{C'} \circ \overline{\text{i}} \\
 h \circ \text{id}_{C'} \circ \overline{\rho} \\
 h \circ \text{id}_{C'} \circ \overline{\text{g}}^1 \circ \overline{\text{f}}^2
 \end{array}
 \tag{124}$$

Step 5. Until now we have computed the two associators appearing in the claim of Corollary 8.1. Using Propositions 5.1 and 7.1 it is not difficult to prove that the 2-morphism

$$\chi(\underline{h})^{-1} \circ (\chi(\underline{g})^{-1} \circ \chi(\underline{f})^{-1}) : \underline{h} \circ (\underline{g} \circ \underline{f}) \Longrightarrow \underline{h}' \circ (\underline{g}' \circ \underline{f}')$$

appearing in the upper part of (107) is represented by the diagram

$$\begin{array}{ccccc}
 & & A^2 & & \\
 & \swarrow & \uparrow & \searrow & \\
 A & & A^4 & & D, \\
 & \swarrow & \downarrow & \searrow & \\
 & & \overline{A}^2 & &
 \end{array}
 \begin{array}{l}
 \text{u} \circ \text{u}^1 \circ \text{u}^2 \\
 \downarrow \alpha^1 \\
 \text{u} \circ \text{id}_{A'} \circ \overline{\text{u}}^1 \circ \overline{\text{u}}^2 \\
 \text{r}^1 \circ \text{r}^3 \circ \text{r}^4 \circ \text{r}^8 \circ \text{r}^{10} \circ \text{r}^{11} \circ \text{r}^{12} \\
 \text{r}^2 \circ \text{r}^3 \circ \text{r}^4 \circ \text{r}^8 \circ \text{r}^{10} \circ \text{r}^{11} \circ \text{r}^{12} \\
 h \circ \text{i} \\
 \downarrow \beta^1 \\
 h \circ \text{id}_{C'} \circ \overline{\text{i}}
 \end{array}
 \tag{125}$$

where α^1 and β^1 are the following compositions:

$$\begin{array}{c}
 A^4 \xrightarrow{\text{r}^3 \circ \text{r}^4 \circ \text{r}^8 \circ \text{r}^{10} \circ \text{r}^{11} \circ \text{r}^{12}} E^1 \begin{array}{l} \xrightarrow{\text{r}^1} A^2 \xrightarrow{\text{u}^2} A^1 \\ \xrightarrow{\text{r}^2} \overline{A}^2 \xrightarrow{\overline{\text{u}}^2} \overline{A}^1 \end{array} \begin{array}{l} \xrightarrow{\text{u}^1} A' \\ \xrightarrow{\overline{\text{u}}^1} A' \end{array} \begin{array}{l} \xrightarrow{\text{u}} A \\ \xrightarrow{\text{u} \circ \text{id}_{A'}} A \end{array} \\
 \downarrow \zeta^1 \\
 \downarrow \pi_{\text{u}}^{-1}
 \end{array}$$

$$\begin{array}{c}
 A^4 \xrightarrow{\text{r}^8 \circ \text{r}^{10} \circ \text{r}^{11} \circ \text{r}^{12}} E^3 \begin{array}{l} \xrightarrow{\text{r}^4} E^2 \xrightarrow{\text{r}^3} E^1 \xrightarrow{\text{r}^1} A^2 \\ \xrightarrow{\text{r}^4} E^2 \xrightarrow{\text{r}^3} E^1 \xrightarrow{\text{r}^2} \overline{A}^2 \end{array} \begin{array}{l} \xrightarrow{\text{l}} C' \\ \xrightarrow{\overline{\text{l}}} C' \end{array} \begin{array}{l} \xrightarrow{h} D \\ \xrightarrow{h \circ \text{id}_{C'}} D \end{array} \\
 \downarrow \varepsilon^2 \\
 \downarrow \pi_h^{-1}
 \end{array}
 \tag{126}$$

Step 6. Using again Propositions 5.1 and 7.1, the composition

$$(\chi(\underline{h}) \circ \chi(\underline{g})) \circ \chi(\underline{f}) : (\underline{h}' \circ \underline{g}') \circ \underline{f}' \Longrightarrow (\underline{h} \circ \underline{g}) \circ \underline{f}$$

appearing in the lower part of (107) is represented by the diagram

$$\begin{array}{ccccc}
 & & \overline{A}^3 & & \\
 & \swarrow^{u \circ \text{id}_{A'} \circ \overline{u}^3} & & \searrow^{h \circ \text{id}_{C'} \circ \overline{g}^1 \circ \overline{f}^2} & \\
 A & & A^4 & & D, \\
 & \searrow_{u \circ u^3} & \uparrow^{r^6 \circ r^7 \circ r^9 \circ r^{10} \circ r^{11} \circ r^{12}} & \downarrow_{\beta^2} & \\
 & & A^3 & & \\
 & & \downarrow_{r^5 \circ r^7 \circ r^9 \circ r^{10} \circ r^{11} \circ r^{12}} & \swarrow_{h \circ g^1 \circ f^2} & \\
 & & & &
 \end{array}
 \tag{127}$$

where α^2 and β^2 are the following compositions:

$$\begin{array}{c}
 A^4 \xrightarrow{r^7 \circ r^9 \circ r^{10} \circ r^{11} \circ r^{12}} E^4 \begin{array}{c} \xrightarrow{r^6} \overline{A}^3 \\ \Downarrow (\zeta^2)^{-1} \\ \xrightarrow{r^5} A^3 \end{array} \begin{array}{c} \xrightarrow{\overline{u}^3} A' \\ \xrightarrow{u^3} A' \end{array} \begin{array}{c} \xrightarrow{u \circ \text{id}_{A'}} A \\ \Downarrow \pi_u \\ \xrightarrow{u} A \end{array} \\
 \\
 A^4 \xrightarrow{r^{12}} E^8 \begin{array}{c} \xrightarrow{r^{11}} E^7 \xrightarrow{r^{10}} E^6 \xrightarrow{r^9} E^5 \xrightarrow{r^7} E^4 \xrightarrow{r^6} \overline{A}^3 \xrightarrow{\overline{f}^2} \overline{B}^2 \\ \xrightarrow{r^{11}} E^7 \xrightarrow{r^{10}} E^6 \xrightarrow{r^9} E^5 \xrightarrow{r^7} E^4 \xrightarrow{r^5} A^3 \xrightarrow{f^2} B^2 \end{array} \begin{array}{c} \xrightarrow{\overline{g}^1} C' \\ \xrightarrow{g^1} C' \end{array} \begin{array}{c} \xrightarrow{h \circ \text{id}_{C'}} D \\ \Downarrow \pi_h \\ \xrightarrow{h} D \end{array} \\
 \Downarrow (\varepsilon^5)^{-1}
 \end{array}
 \tag{128}$$

Step 7. Now we have to compute (107), i.e., the vertical composition of:

- (a) $\chi(\underline{h})^{-1} \circ (\chi(\underline{g})^{-1} \circ \chi(\underline{f})^{-1})$, represented by (125);
- (b) $\Theta_{\underline{h}', \underline{g}', \underline{f}'}^{\mathcal{C}, \mathbf{W}}$, represented by (124);
- (c) $(\chi(\underline{h}) \circ \chi(\underline{g})) \circ \chi(\underline{f})$, represented by (127).

We compose (a) and (b) using Proposition 5.1: since the map $A^4 \rightarrow \overline{A}^2$ in (125) coincides with the map $A^4 \rightarrow \overline{A}^2$ in (124), we can choose

$$(A^4, \text{id}_{A^4}, \text{id}_{A^4}, i_{r^2 \circ r^3 \circ r^4 \circ r^8 \circ r^{10} \circ r^{11} \circ r^{12}})$$

as the data (C, t^1, t^2, ρ) needed in (F4). So the composition of (a) and (b) is represented

by the following diagram:

$$\begin{array}{ccccc}
 & & A^2 & & \\
 & \swarrow & \uparrow & \searrow & \\
 & u \circ u^1 \circ u^2 & \begin{array}{c} r^1 \circ r^3 \circ r^4 \circ r^8 \circ \\ \circ r^{10} \circ r^{11} \circ r^{12} \end{array} & h \circ l & \\
 A & \xleftarrow{\Downarrow (u \circ \text{id}_{A'} \circ \bar{\gamma}) \circ \alpha^1} & A^4 & \xrightarrow{\Downarrow (h \circ \text{id}_{C'} \circ \bar{\rho}) \circ \beta^1} & D \\
 & \swarrow & \downarrow & \searrow & \\
 & u \circ \text{id}_{A'} \circ \bar{u}^3 & \begin{array}{c} r^6 \circ r^7 \circ r^9 \circ \\ \circ r^{10} \circ r^{11} \circ r^{12} \end{array} & h \circ \text{id}_{C'} \circ \bar{g}^1 \circ \bar{f}^2 & \\
 & & \bar{A}^3 & &
 \end{array} \tag{129}$$

Using the same ideas on the pair of diagrams (129) and (127), the composition of (a), (b) and (c) is represented by the following diagram:

$$\begin{array}{ccccc}
 & & A^2 & & \\
 & \swarrow & \uparrow & \searrow & \\
 & u \circ u^1 \circ u^2 & \begin{array}{c} r^1 \circ r^3 \circ r^4 \circ r^8 \circ \\ \circ r^{10} \circ r^{11} \circ r^{12} \end{array} & h \circ l & \\
 A & \xleftarrow{\Downarrow \alpha^2 \circ (u \circ \text{id}_{A'} \circ \bar{\gamma}) \circ \alpha^1} & A^4 & \xrightarrow{\Downarrow \beta^2 \circ (h \circ \text{id}_{C'} \circ \bar{\rho}) \circ \beta^1} & D \\
 & \swarrow & \downarrow & \searrow & \\
 & u \circ u^3 & \begin{array}{c} r^5 \circ r^7 \circ r^9 \circ \\ \circ r^{10} \circ r^{11} \circ r^{12} \end{array} & h \circ g^1 \circ f^2 & \\
 & & \bar{A}^3 & &
 \end{array} \tag{130}$$

Above we replace $\bar{\gamma}$ with (121) and $\bar{\rho}$ with (122). In addition, we replace α^1 , β^1 , α^2 and β^2 with their definitions in (126) and (128). Then we simplify the terms of the form $\pi_u, \pi_h, \zeta^1, \zeta^2, \varepsilon^2$ and ε^5 with their inverses. So on the left hand side of (130) we get $u \circ \zeta^3 \circ r^{10} \circ r^{11} \circ r^{12} = u \circ \gamma$, and on the right hand side we get $h \circ \rho$. In other terms, (130) coincides with (119). By construction (130) represents the composition of (107), and (119) represents $\Theta_{\underline{h}, \underline{g}, \underline{f}}^{\mathcal{C}, \mathbf{W}}$, so we conclude. \blacksquare

9. Appendix - An alternative description of 2-morphisms in a bicategory of fractions

Proposition 1.1 suggests an alternative construction of 2-morphisms in $\mathcal{C}[\mathbf{W}^{-1}]$. This new construction is equivalent to the original one of [P1996], but much simpler. Let us suppose that we want to define a 2-morphism from the morphism $\underline{f}^1 := (A^1, w^1, f^1)$ to the morphism $\underline{f}^2 := (A^2, w^2, f^2)$ (both defined from A to B). Since the composition of 1-morphisms in $\mathcal{C}[\mathbf{W}^{-1}]$ depends on the set of choices $\mathbf{C}(\mathbf{W})$, such choices must be *fixed* before constructing the bicategory of fractions (and such a bicategory depends on these choices). Since they are fixed, there is no harm in using them in order to get data

(E, p, q, ς) in \mathcal{C} as below, with p in \mathbf{W} and ς invertible:

$$\begin{array}{ccc}
 & E & \\
 p \swarrow & \Downarrow \varsigma & \searrow q \\
 A^1 & \xrightarrow{w^1} A \xleftarrow{w^2} & A^2.
 \end{array} \tag{131}$$

Then we give the following definition:

9.1. DEFINITION. *Let us fix any pair $(\mathcal{C}, \mathbf{W})$ satisfying conditions (BF), and any set of choices $\mathbf{C}(\mathbf{W})$; let $\mathcal{C}[\mathbf{W}^{-1}]$ be the bicategory of fractions induced by such choices (see Theorem 1.2). Then an almost canonical representative of a 2-morphism in $\mathcal{C}[\mathbf{W}^{-1}]$ from \underline{f}^1 to \underline{f}^2 is any triple (A^3, t, φ) where $t : A^3 \rightarrow E$ is a morphism in \mathbf{W} , and φ is a 2-morphism in \mathcal{C} from $f^1 \circ p \circ t$ to $f^2 \circ q \circ t$. Given another triple $(A^3, t' : A^3 \rightarrow E, \varphi' : f^1 \circ p \circ t' \Rightarrow f^2 \circ q \circ t')$, we say that it is equivalent to the previous one, and we write $(A^3, t, \varphi) \sim (A^3, t', \varphi')$ if and only if there are data (A^4, u, u', σ) in \mathcal{C} as follows*

$$\begin{array}{ccc}
 & E & \\
 t' \swarrow & \Downarrow \sigma & \searrow t \\
 A^3 & \xleftarrow{u'} A^4 \xrightarrow{u} & A^3,
 \end{array}$$

such that:

- u belongs to \mathbf{W} ;
- σ is invertible;
- the compositions of the following two diagrams are equal:

$$\begin{array}{ccc}
 \begin{array}{ccccc}
 & A^3 & \xrightarrow{t'} & E & \xrightarrow{p} & A^1 & \xrightarrow{f^1} & B \\
 u' \nearrow & \downarrow \sigma & \searrow t & & & \downarrow \varphi & & \\
 A^4 & \xrightarrow{u} & A^3 & & & & & \\
 u' \searrow & \downarrow \sigma^{-1} & \nearrow t & & & & & \\
 & A^3 & \xrightarrow{t'} & E & \xrightarrow{q} & A^2 & \xrightarrow{f^2} & B
 \end{array} & , & \begin{array}{ccccc}
 & E & \xrightarrow{p} & A^1 & \xrightarrow{f^1} & B \\
 t' \nearrow & \downarrow \varphi' & \searrow & & & \\
 A^4 & \xrightarrow{u'} & A^3 & & & \\
 t' \searrow & & E & \xrightarrow{q} & A^2 & \xrightarrow{f^2} & B
 \end{array}
 \end{array} \tag{132}$$

A 2-morphism in $\mathcal{C}[\mathbf{W}^{-1}]$ is any class of equivalence of data as above, denoted by

$$[A^3, t, \varphi] : (A^1, w^1, f^1) \Rightarrow (A^2, w^2, f^2).$$

As you can see, this definition is much shorter than the original one (that we recalled in the Introduction). It is not too hard to prove that:

- (a) \sim is actually an equivalence relation (so Definition 9.1 is well-posed);
- (b) there is a natural bijection between 2-morphisms according to Definition 9.1 and 2-morphisms according to the original definition of [P1996], induced by associating to any triple (A^3, t, φ) the equivalence class of the following diagram:

$$\begin{array}{ccccc}
 & & A^1 & & \\
 & \swarrow w^1 & & \searrow f^1 & \\
 A & & & & B \\
 & \searrow w^2 & & \swarrow f^2 & \\
 & & A^2 & & \\
 & & \uparrow p \circ t & & \\
 & & A^3 & & \\
 & \Downarrow \zeta \circ t & & \Downarrow \varphi & \\
 & & A^2 & &
 \end{array}
 \tag{133}$$

The result above can be rephrased by saying that each 2-morphism in $\mathcal{C}[\mathbf{W}^{-1}]$ (defined according to [P1996]) has a representative given by a diagram of type (133) for a triple (A^3, t, φ) that is “almost canonical” (having fixed the set of choices $\mathbf{C}(\mathbf{W})$ that completely determine the structure of $\mathcal{C}[\mathbf{W}^{-1}]$, see Theorem 1.2). “Almost canonical” here refers to the fact that the triple (A^3, t, φ) inducing a given 2-morphism is almost unique and varies in a much smaller set if compared to the set of diagrams as (4). We cannot say “canonical” since sometimes there is more than one such triple inducing the same 2-morphism (this is why we need to use the equivalence relation given in Definition 9.1).

The description of 2-cells of $\mathcal{C}[\mathbf{W}^{-1}]$ in terms of “almost canonical” triples is simpler than the original one in [P1996], but does not interact well with vertical and horizontal composition. Therefore we are just mentioning it here in the Appendix, and we leave the proof of (a) and (b) as an useful exercise for the interested reader (hint: use the axioms (BF) together with the lemmas stated in § 2 and § 3, and the definition of 2-cells of $\mathcal{C}[\mathbf{W}^{-1}]$ that we recalled in the Introduction).

THEORY AND APPLICATIONS OF CATEGORIES (ISSN 1201-561X) will disseminate articles that significantly advance the study of categorical algebra or methods, or that make significant new contributions to mathematical science using categorical methods. The scope of the journal includes: all areas of pure category theory, including higher dimensional categories; applications of category theory to algebra, geometry and topology and other areas of mathematics; applications of category theory to computer science, physics and other mathematical sciences; contributions to scientific knowledge that make use of categorical methods.

Articles appearing in the journal have been carefully and critically refereed under the responsibility of members of the Editorial Board. Only papers judged to be both significant and excellent are accepted for publication.

Full text of the journal is freely available from the journal's server at <http://www.tac.mta.ca/tac/>. It is archived electronically and in printed paper format.

SUBSCRIPTION INFORMATION Individual subscribers receive abstracts of articles by e-mail as they are published. To subscribe, send e-mail to tac@mta.ca including a full name and postal address. For institutional subscription, send enquiries to the Managing Editor, Robert Rosebrugh, rrosebrugh@mta.ca.

INFORMATION FOR AUTHORS The typesetting language of the journal is \TeX , and $\text{\LaTeX}2\text{e}$ is required. Articles in PDF format may be submitted by e-mail directly to a Transmitting Editor. Please obtain detailed information on submission format and style files at <http://www.tac.mta.ca/tac/>.
